A15-161	4 MFD 50 Volt Electrolytic Capacitor
A15-162	4 MFD 50 Volt Electrolytic Capacitor
A15-163	4 MFD 50 Volt Electrolytic Capacitor

This receiver has been designed to operate on a self-contained battery containing both the "B" battery (90 Volts) and the "A" battery (1 1/2 Volts) such as General #60B61.

The battery cable coming from the receiver has been made long enough so that it may be used with larger batteries placed outside of the cabinet. Any one of the following batteries can be used with this receiver when they are placed on the outside of the cabinet: Eveready No. 748, General No. 60DL-11 L, Burgess No. 17G-D60, Ray-O-Vac No. AB 82.

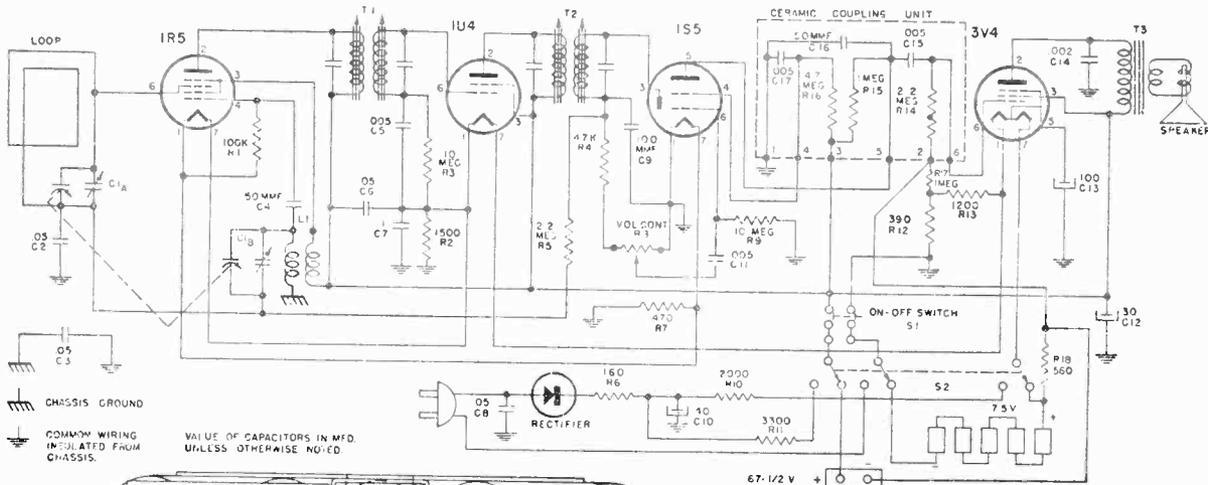

This model is a 4-Tube Superheterodyne radio receiver designed to cover a frequency range of from 540 kilocycles to 1725 kilocycles (K.C.). The tubes used are —
 1A7 GT—Osc. Converter
 1H5 GT—A.V.C Det. Audio Amplifier
 1N5 GT—I. F. Amplifier
 3Q5 GT—Power Output

ALIGNMENT PROCEDURE

With an output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 30% at 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

Connect the signal generator to the grid cap of the 1A7 GT Tube through a .1 MFD. Condenser. Connect the ground lead of the generator to the chassis. Adjust the signal generator to 455 K.C. and set the variable condenser of the receiver to minimum capacity (fully opened). With the volume control full on and minimum output from the signal generator adjust the two trimmers on the first and second I.F. transformers for maximum output.

Now connect the signal generator to the antenna connection of the receiver through a .00025 condenser. Adjust the signal generator frequency to 1725 K.C. and set the variable condenser to minimum capacity (fully opened), and adjust the oscillator trimmer (C18) for maximum output. Set signal generator to 1500 K.C. and tune receiver to signal. Adjust the antenna trimmer (C1A) on the variable condenser for maximum output.

PARTS LIST

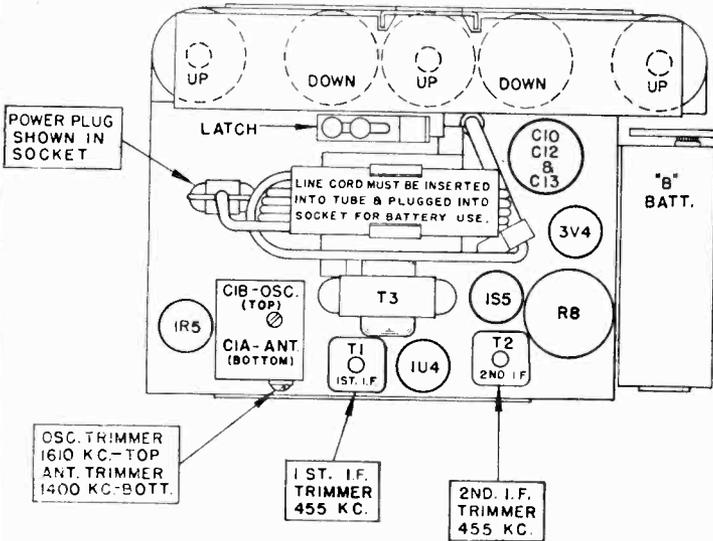

Fig. 1. Tube, Trimmer and Battery Locations

CODE NO.	PART NO.	DESCRIPTION
C1A, C1B	B19-197	Variable condenser
C2, C6	A16-152	.05 MFD 200 volt condenser
C3	A16-189	.50 MFD 400 volt condenser
C4	A16-175	50 MMF mica condenser
C5, C11	A16-153	.005 MFD 500 volt condenser
C7	A16-157	.1 MFD 200 volt condenser
C8	A16-172	.05 MFD 400 volt condenser
C9	A15-188	100 MMF mica condenser
C10, 12, 13	A18-290	40-30 MFD 150 volt, 100 MFD 10 volt, electrolytic
C14	A16-182	.002 MFD 200 volt condenser
C15, 16, 17	A17-180	.005 MMF, .005 MFD, 50 MMF. See note below.
R1	A60-671	1500 ohm 1/2 watt 20% resistor
R2	A60-680	10 megohm 1/2 watt 20% resistor
R3, R9	A60-663	10 megohm 1/2 watt 20% resistor
R4	A60-685	47K ohm 1/2 watt 20% resistor
R5	A60-684	2.2 megohm 1/2 watt 20% resistor
R6	A60-725	160 ohm 5 watt 10% resistor
R7	A60-722	470 ohm 1/2 watt 10% resistor
R8, S1	A24-178	Volume control, with switch
R10	A60-757	2000 ohm 10 watt 10% resistor
R11	A60-724	3300 ohm 1 watt 10% resistor
R12	A60-665	390 ohm 1/2 watt 10% resistor
R13	A60-756	1200 ohm 1/2 watt 10% resistor
R14, 15, 16	A17-100	2.2 megohm, 1 megohm, 4.7 megohm. See note below.
NOTE: C15, C16, C17, R14, R15, R16 are contained in the Ceramic Coupling Unit Port		
No. A17-100		
R17	A60-688	1 megohm, 1/2 watt 20% resistor
R18	A60-758	560 ohm 1/2 watt 10% resistor
L1	A10-514	Oscillator coil
T1, T2	C10-475	1st and 2nd I.F. transformer
T3	B80-245	Output transformer
S2	A69-182	Switch, AC-DC, battery
	S84-242	Bracket, "A" battery retainer
	S84-278	Cover, front, grey (with loop)
	S84-281	Cover, front, maroon (with loop)
	S84-128	Cover, rear, grey
	S84-169	Cover, rear, maroon
	D21-108	End-cap, for handle
	A83-421	Clip, I.F. transformer mounting
	B83-442	Handle, rubber, grey
	A83-494	Handle, rubber, black
	S84-243	Hub and pointer assembly
	C52-216	Knob, tuning, grey
	A52-229	Knob, tuning, maroon
	B52-217	Knob, volume control, grey
	A52-232	Knob, volume control, maroon
	A83-568	Rectifier, selenium
	B79-364	Speaker, 4" P.M.
	A76-49	Terminal, for "B" battery

ALIGNMENT PROCEDURE

(See schematic diagram.)

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker; the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.

For alignment points refer to Figure No. 1.

CAUTION: This is an A.C.-D.C. receiver and if alignment is made with the receiver connected to 117 volts A.C. or D.C., it is necessary to isolate the signal generator or the receiver from the line by use of a transformer, or place a .2 M.F.D. condenser in both test leads of the Signal Generator.

Position of Variable	Generator Frequency	Dummy Ant. Mid.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	*1R5 Grid (Stator of C1A)	T2	Output I.F.
Fully open	455 KC	.1	*1R5 Grid (Stator of C1A)	T1	Input I.F.
Fully open	1600 KC	.1	*1R5 Grid (Stator of C1A)	C1B	Oscillator
Tune in signal from generator	1400 KC	—	Loosely coupled to loop	C1A	Antenna

*Connect ground lead of signal generator to common negative.

- 1R5—Mixer, Oscillator
- 1U4—I.F. Amplifier
- 1S5—Detector and 1st Audio
- 3V4—Power output

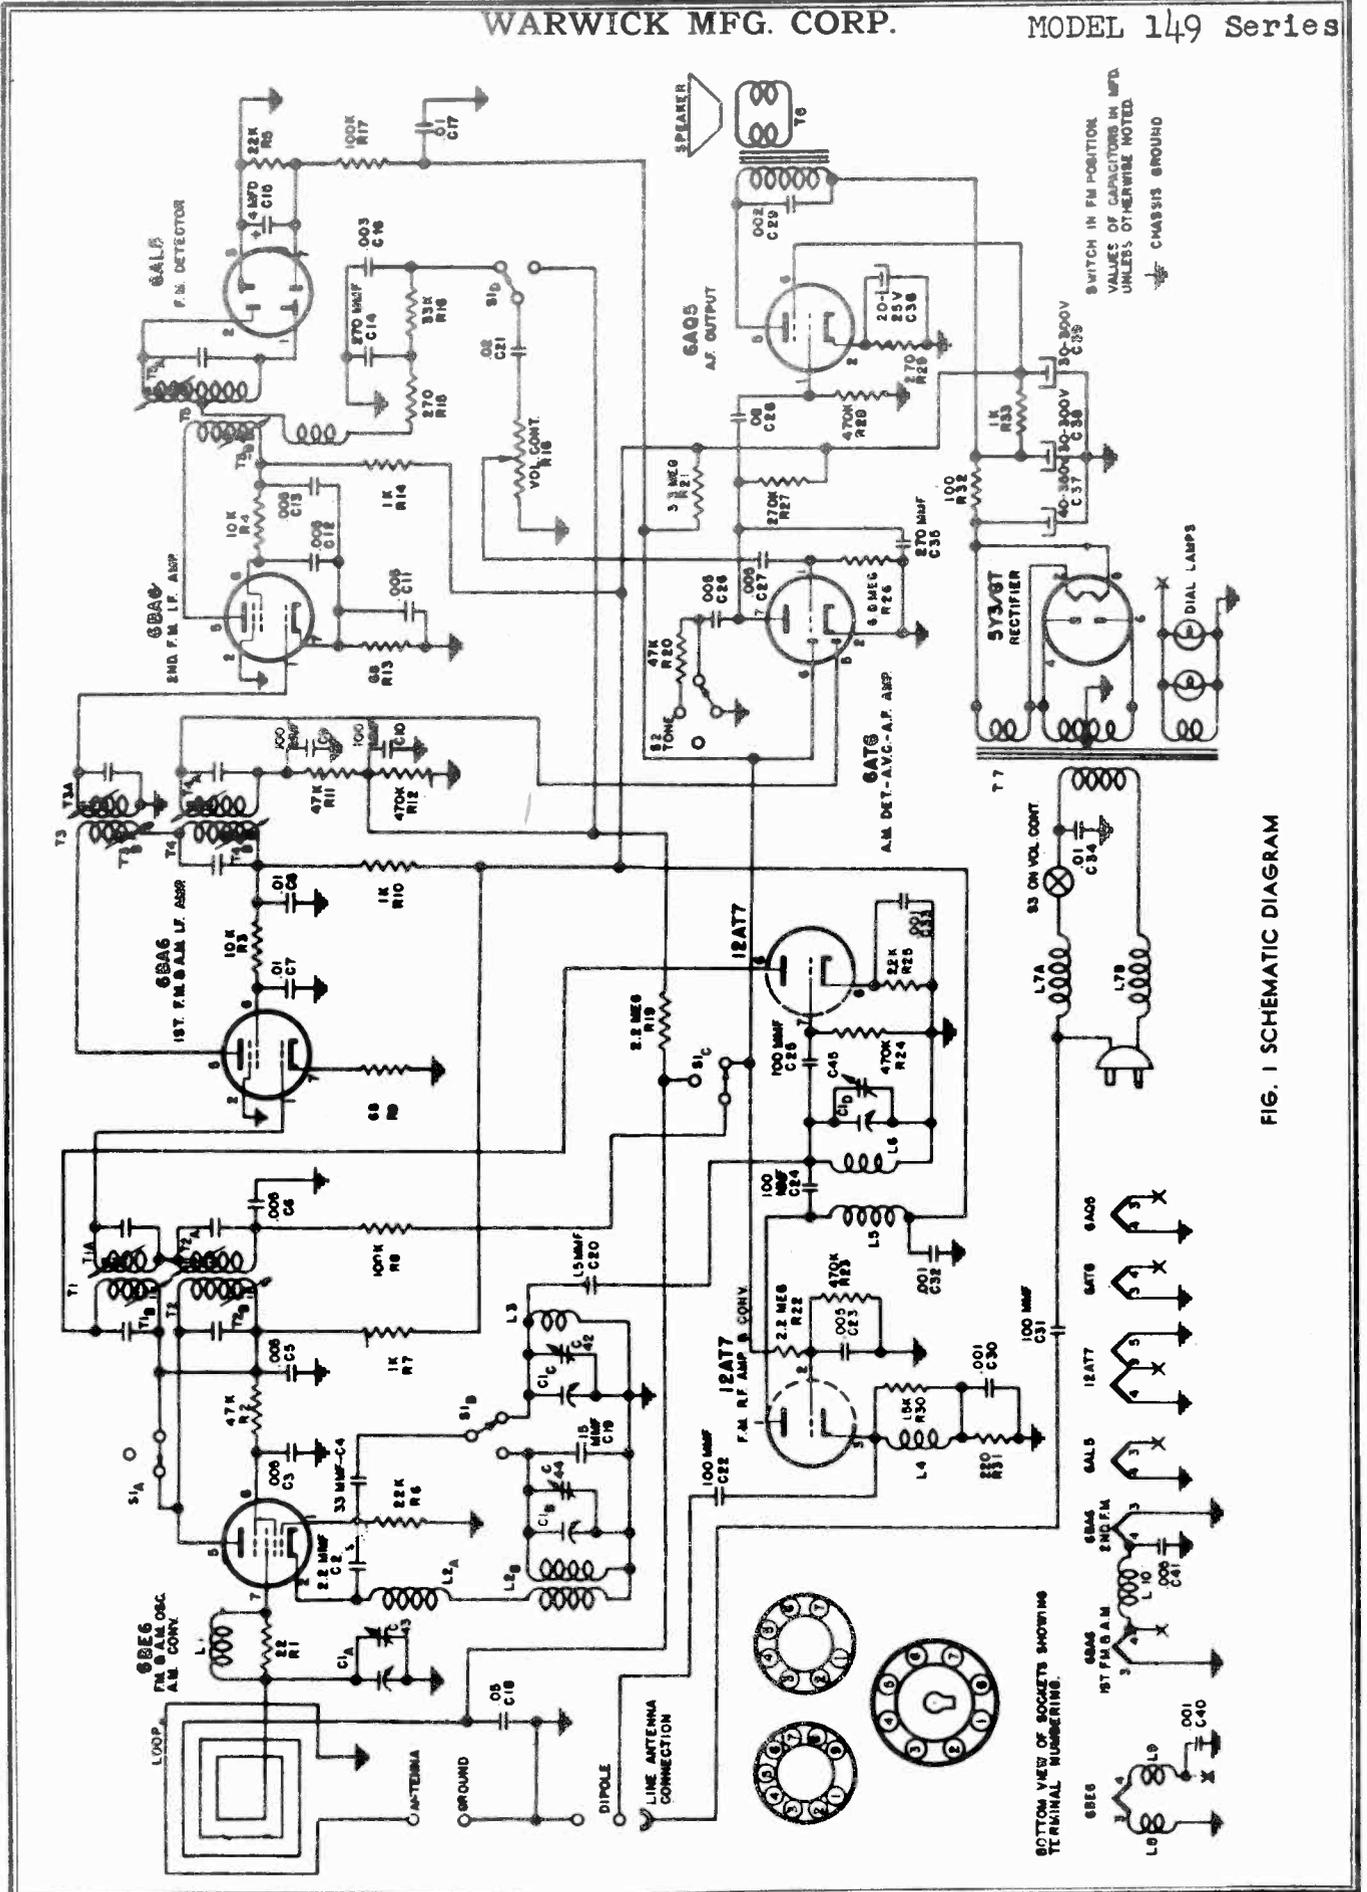

FIG. 1 SCHEMATIC DIAGRAM

SPECIFICATIONS

Power Supply..... 105-125 volts 60 cycle AC only.
 Power Consumption..... 65 Watts
 Frequency Range FM..... 88 to 108 MC.
 Frequency Range AM..... 540 to 1600 KC.
 I.F. Frequency FM..... 10.7 MC.
 I.F. Frequency AM..... 455 KC.
 Band width, FM, Ratio Detector..... 330 KC.
 Band width, FM, 1st I.F..... 280 KC.
 Band width, FM, Converter..... 220 KC.
 Speaker..... 6 $\frac{1}{4}$ " P.M.

The tubes used are as follows:

12AT7 FM RF Amplifier, Converter
 6BE6 FM Osc, Am Osc, Converter
 6BA6 FM-AM, 1st I.F. Amplifier
 6BA6 FM-AM, 2nd I.F. Amplifier
 6AL5 FM Detector
 6AT6 AM Detector, AVC, Audio
 6AQ5 Power Output
 5Y3 Power Rectifier
 No. 47 Pilot Lights (2)

SERVICE NOTES

INSTALLATION

This receiver is shipped from the factory complete with a built-in loop antenna for standard AM broadcast reception. A power-line antenna is used for the reception of FM stations. These antennas will be satisfactory for good reception under normal conditions. Terminals are provided at the back of the radio for connecting external AM and FM antennas, wherever this is found to be desirable as explained below.

When the receiver is to be used under difficult conditions, such as in buildings constructed mainly of steel, or those with steel lath, or, when large buildings, mountains or other objects are between the receiver and the station to be received, it may be necessary to use an external dipole antenna. Remember too, FM reception is limited as to distance and when used outside the primary service area of the transmitter, an outside antenna is very necessary.

The type of dipole to be used depends upon the signal strength of the station in that particular area, as well as conditions of reception as outlined above. There are three types of FM dipole antenna available, the single dipole, the folded dipole, and the non-directional dipole. When the stations to be received are in one general direction, a reflector may be added to either of the first two types to increase their efficiency.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and oscilloscopes. All R.F. and I.F. circuits have been accurately adjusted at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.
 AM Signal generator
 FM Sweep generator.
 Oscilloscope.
 Insulated screw driver.
 Dummy antenna:
 .1 MFD condenser
 .00025 MFD mica condenser
 150 ohm resistor (2)
 Output meter.

SERVICE NOTES

INSTALLATION

This receiver is shipped from the factory complete with a built-in loop antenna for standard AM broadcast reception. A power-line antenna is used for the reception of FM stations. These antennas will be satisfactory for good reception under normal conditions. Terminals are provided at the back of the radio for connecting external AM and FM antennas, wherever this is found to be desirable as explained below.

When the receiver is to be used under difficult conditions, such as in buildings constructed mainly of steel, or those with steel lath, or, when large buildings, mountains or other objects are between the receiver and the station to be received, it may be necessary to use an external dipole antenna. Remember too, FM reception is limited as to distance and when used outside the primary service area of the transmitter, an outside antenna is very necessary.

The type of dipole to be used depends upon the signal strength of the station in that particular area, as well as conditions of reception as outlined above. There are three types of FM dipole antenna available, the single dipole, the folded dipole, and the non-directional dipole. When the stations to be received are in one general direction, a reflector may be added to either of the first two types to increase their efficiency.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and oscilloscopes. All R.F. and I.F. circuits have been accurately adjusted at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.
 AM Signal generator
 FM Sweep generator.
 Oscilloscope.
 Insulated screw driver.
 Dummy antenna:
 .1 MFD condenser
 .00025 MFD mica condenser
 150 ohm resistor (2)
 Output meter.

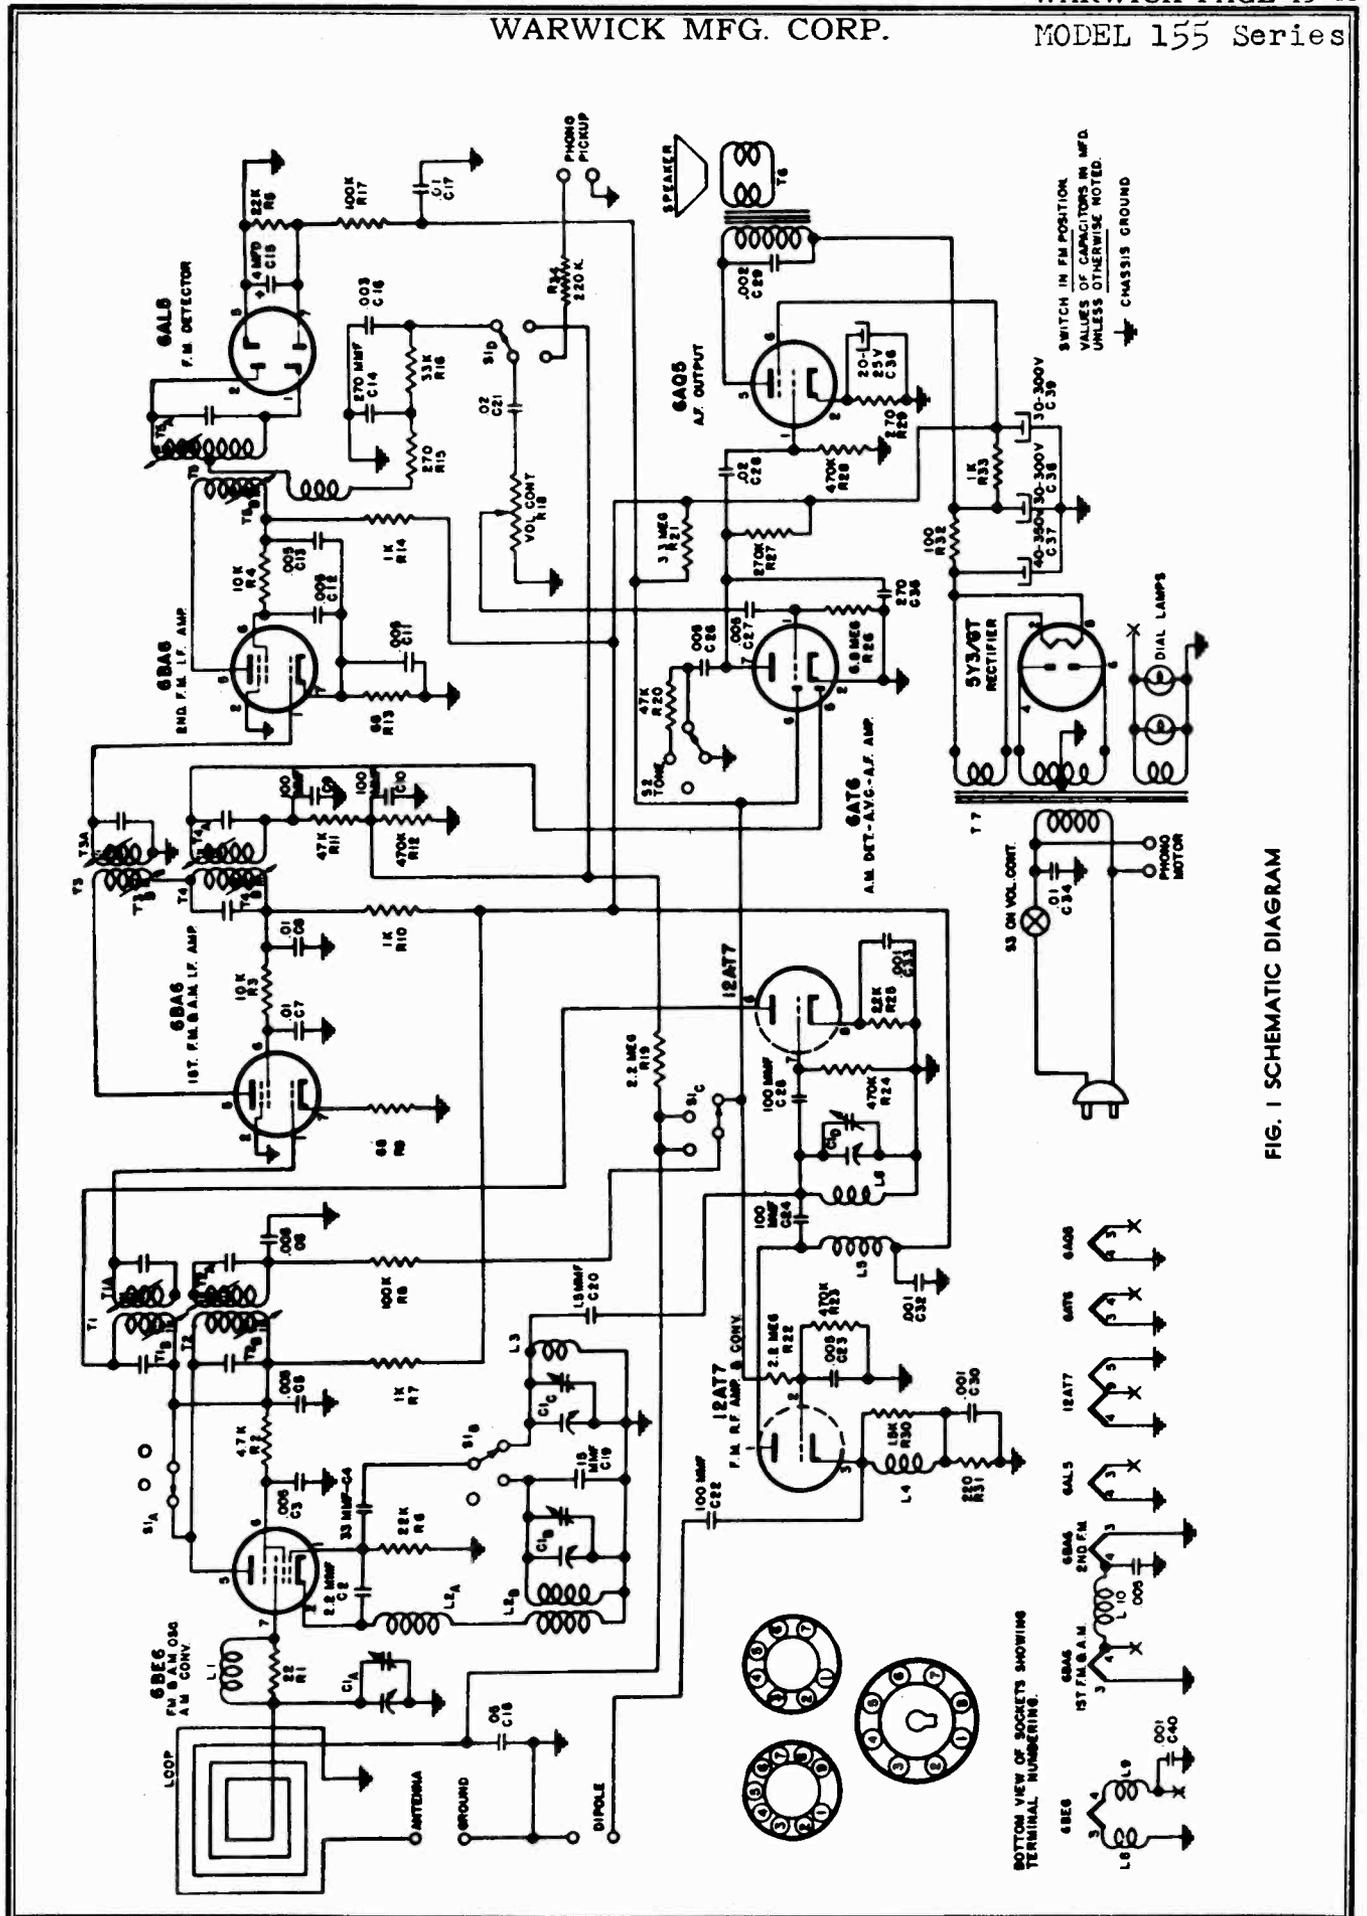

FIG. 1 SCHEMATIC DIAGRAM

SPECIFICATIONS

Power Supply.....105-125 volts 60 cycle AC only.
 Power Consumption.....65 Watts
 Frequency Range FM.....88 to 108 MC.
 Frequency Range AM.....540 to 1600 KC.
 I.F. Frequency FM.....10.7 MC.
 I.F. Frequency AM.....455 KC.
 Band width, FM, Ratio Detector.....330 KC.
 Band width, FM, 1st I.F.....280 KC.
 Band width, FM, Converter.....220 KC.
 Speaker.....6 $\frac{1}{4}$ " P.M.

The tubes used are as follows:

12AT7 FM RF Amplifier, Converter
 6BE6 FM Osc, Am Osc, Converter
 6BA6 FM-AM, 1st I.F. Amplifier
 6BA6 FM-AM, 2nd I.F. Amplifier
 6AL5 FM Detector
 6AT6 AM Detector, AVC, Audio
 6AQ5 Power Output
 5Y3 Power Rectifier
 No. 47 Pilot Lights (2)

SERVICE NOTES

INSTALLATION

This receiver is shipped from the factory complete with a built-in loop antenna for standard AM broadcast reception. A power-line antenna is used for the reception of FM stations. These antennas will be satisfactory for good reception under normal conditions. Terminals are provided at the back of the radio for connecting external AM and FM antennas, wherever this is found to be desirable as explained below.

When the receiver is to be used under difficult conditions, such as in buildings constructed mainly of steel, or those with steel lath, or, when large buildings, mountains or other objects are between the receiver and the station to be received, it may be necessary to use an external dipole antenna. Remember too, FM reception is limited as to distance and when used outside the primary service area of the transmitter, an outside antenna is very necessary.

The type of dipole to be used depends upon the signal strength of the station in that particular area, as well as conditions of reception as outlined above. There are three types of FM dipole antenna available, the single dipole, the folded dipole, and the non-directional dipole. When the stations to be received are in one general direction, a reflector may be added to either of the first two types to increase their efficiency.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and oscilloscopes. All R.F. and I.F. circuits have been accurately adjusted at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given on page 5.

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.
 AM Signal generator
 FM Sweep generator.
 Oscilloscope.
 Insulated screw driver.
 Dummy antenna:
 .1 MFD condenser
 .00025 MFD mica condenser
 150 ohm resistor (2)
 Output meter.

DESCRIPTION

Model 11901 is a 6 tube (including rectifier) superhetrodyne radio receiver designed for operation on 50-60 cycle 105-125 volt, AC current.

The tubes used are:

- | | |
|---------------------|----------------------|
| 6SK7 R.F. Amplifier | 6SQ7 Det, AVC, audio |
| 6SA7 Mixer, Osc. | 6K6GT Power Output |
| 6SK7 I.F. Amplifier | 5Y3GT Rectifier |

This receiver covers the standard broadcast frequency range from 535 to 1725 kilocycles (K.C.) and the shortwave frequency range from 6 to 18.2 Megacycles (MC).

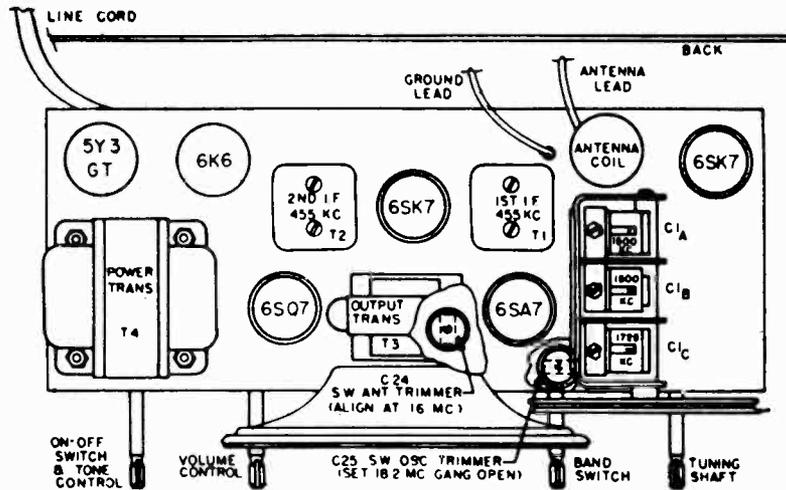

Fig. 2 Tube Positions and Alignment Points

ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

With an output meter connected across the voice coil of the speaker, the output meter reading for 1/2 watt is 1.25 volts, using a signal which is modulated 400 C.P.S. Follow through the procedure as outlined below for proper alignment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, for accurate alignment.

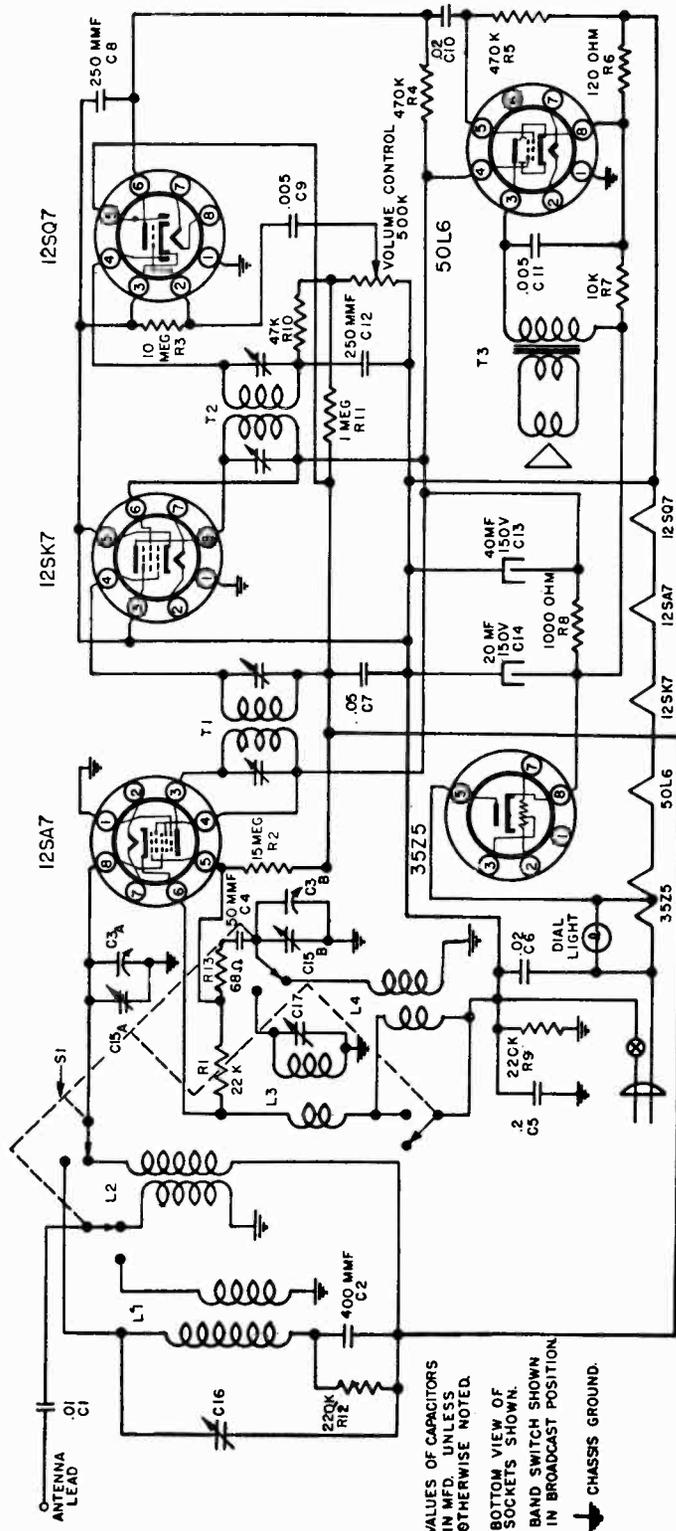

Position of Variable	Band Switch Position	Generator Frequency	Dummy Ant.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	BC	455 KC	.1 MFD.	6SA7 Grid (stator of C1B)	T1 T2	I. F.
Fully open	BC	1725 KC	.00025 MFD.	Ant. lead	C1C	BC Osc.
Tune in signal from generator	BC	1500 KC	.00025 MFD.	Ant. lead	C1B	R. F.
Tune in signal from generator	BC	1500 KC	.00025 MFD.	Ant. lead	C1A	BC Ant.
Fully open	SW	18.2 MC	400 ohms	Ant. lead	C25	SW Osc.
Tune in signal from generator	SW	16 MC	400 ohms	Ant. lead	C24	SW Ant.

GROUND lead of generator should be attached to the chassis for all adjustments

C24 and C25 are located under the chassis

For alignment points refer to Figure 2

Repeat alignment procedure as a final check

DESCRIPTION

Model 12001 is a 5 tube (including rectifier) super-heterodyne radio receiver designed for use on 105-125 volt A.C., 60 cycle, or 117 volt D.C. current.

The tubes are:—

- 1—12SA7 Oscillator, converter
- 1—12SK7 I.F. Amplifier
- 1—12SQ7 AVC, Detector, 1st audio
- 1—50L6GT Power Output
- 1—35Z5GT Rectifier

This receiver covers the standard broadcast frequency range of 535 to 1725 K.C. (560 to 174 meters), and the Short Wave frequency range of 9 to 18.2 Mega-cycles (33 to 16.5 meters).

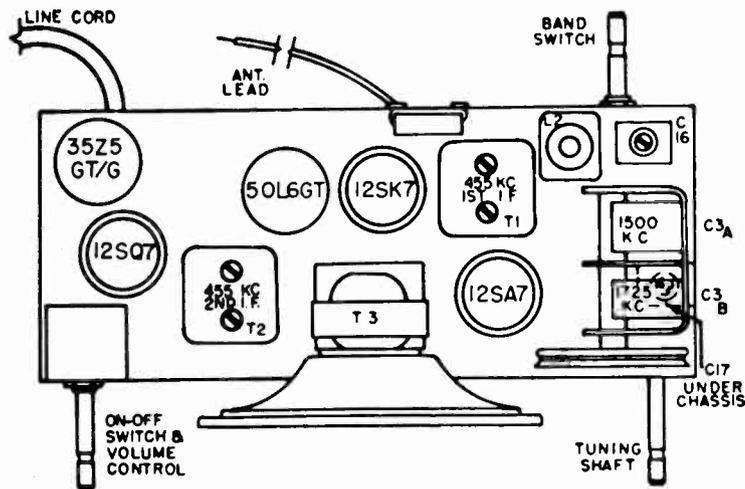

ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control full on and the output from the signal generator as low as possible to prevent AVC action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts, using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure as a final check.

ALIGNMENT PROCEDURE—Continued

CAUTION: This is an AC-DC receiver and when aligning the set it is necessary to isolate the signal generator or the receiver from the line by use of a transformer, or place a .2 MFD condenser in both test leads of the signal generator.

Before proceeding with actual alignment the dial pointer must be set to the proper position. With the variable condenser fully open the dial pointer should read 1725 K.C.

Position of Variable	Band Switch Position	Generator Frequency	Dummy Ant.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	B. C.	455 KC	.1 MFD	* 12SA7 Grid (Stator of C3A)	T1 - T2	I. F.
Fully open	B. C.	1725 KC	.00025 MFD	* Ant. lead	** C3B	B. C. Oscillator
Tune in signal from generator	B. C.	1400 KC	.00025 MFD	* Ant. lead	** C3A	B. C. Antenna
16 MC	S. W.	16 MC	400 ohms	* Ant. lead	C17	S. W. Oscillator
16 MC	S. W.	16 MC	400 ohms	* Ant. lead	C16	S. W. Antenna

* Connect ground lead of signal generator to "Common B."

** C3A, C3B, are located on variable condenser

NOTE: The above procedure must be followed in exact sequence for proper alignment.

SPECIFICATIONS

Power Supply.....117 volts AC 60 cycle
 Power Consumption.....95 Watts
 Frequency Range FM.....88 to 108 MC.
 Frequency Range AM.....540 to 1600 KC.
 I.F. frequency FM.....10.7 MC.
 I.F. frequency AM.....455 KC.
 Band width, FM, Ratio detector.....360 KC.
 Band width, FM, 2nd I.F.....280 KC.
 Band width, FM, 1st I.F.....240 KC.
 Band width, FM, Converter.....180 KC.
 Tubes.....10
 Rectifiers.....Selenium, 150 ma.
 Speaker.....10" P.M.

The tubes used are as follows:
 12BA6 FM, R.F. Amplifier
 12BE6 FM, Converter
 12BA6 FM, 1st I.F. Amplifier
 12BA6 FM, 2nd I.F. Amplifier
 12BA6 FM, 3rd I.F. Amplifier
 6AL5 FM, Ratio detector
 12BE6 AM, Converter
 12BA6 AM, I.F. Amplifier
 12AT6 AM, Detector-AVC-1st audio
 50L6GT Power output
 A83-463 Selenium rectifier (2)
 No. 47 Pilot lights (2)

SERVICE NOTES

INSTALLATION

The loop antenna provided with the receiver will prove adequate for the reception of all AM stations under normal operating conditions. The flexible folded dipole antenna will be adequate for the reception of powerful or near-by FM stations except when the set is used in a building constructed mainly of steel or where FM reception is otherwise difficult. When the radio is used with the inside antenna as provided, it is suggested that you try placing the set in different locations in the room. FM reception especially will vary greatly according to the location of the antenna within the room.

When it is desired to receive FM stations outside of the primary service area, or if the receiver is being used under difficult conditions, the use of an outside dipole antenna is recommended. There are three types of such aerials, namely single dipole, the folded dipole, and the non-directional dipole. To increase the "pick-up" or sensitivity, a reflector may be used with either of the first two types. The proper type of antenna as well as its location are determined by the terrain and distance from the station to be received, the direction, etc. Your local service man will advise you of the proper antenna installation, for your particular area. Two terminals are provided on the back of the set for connecting the outside dipole antenna leads.

FM reception is very directional, and even when using the FM antenna furnished with the receiver, reception can sometimes be very much improved by turning the receiver in a different direction. Be careful not to place the radio close to large metal objects as this might tend to cause reflections or otherwise interfere with good reception.

CAUTION: Always disconnect the line cord before removing the back for tube replacement, etc.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and Oscilloscopes. All I.F. circuit adjustments have been sealed at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given on page 5. This receiver employs the "double peak" type of I.F. circuits, and can not be satisfactorily aligned with conventional AM equipment. Visual alignment procedures must be used.

EQUIPMENT USED FOR ALIGNMENT

AM Signal generator
 FM Sweep generator.
 Oscilloscope.
 Vacuum tube voltmeter.
 Insulated screw driver.
 Dummy antenna:
 .1 MFD condenser
 .00025 MFD mica condenser
 150 ohm resistor (2)
 Output meter.

All voltage readings are taken from tube pin to chassis.
 All measurements are made with no signal, using a 20,000 ohm per volt meter.
 AC input voltage must be maintained at 117 volts for accurate readings.
 AC voltages shown are at 1000 ohms per volt.
 All voltages shown are approximate.

All resistance readings are taken from tube pin to chassis.
 Due to manufacturing tolerance on component parts, resistance readings may vary as much as 20%.
 All readings are shown in ohms unless otherwise noted.

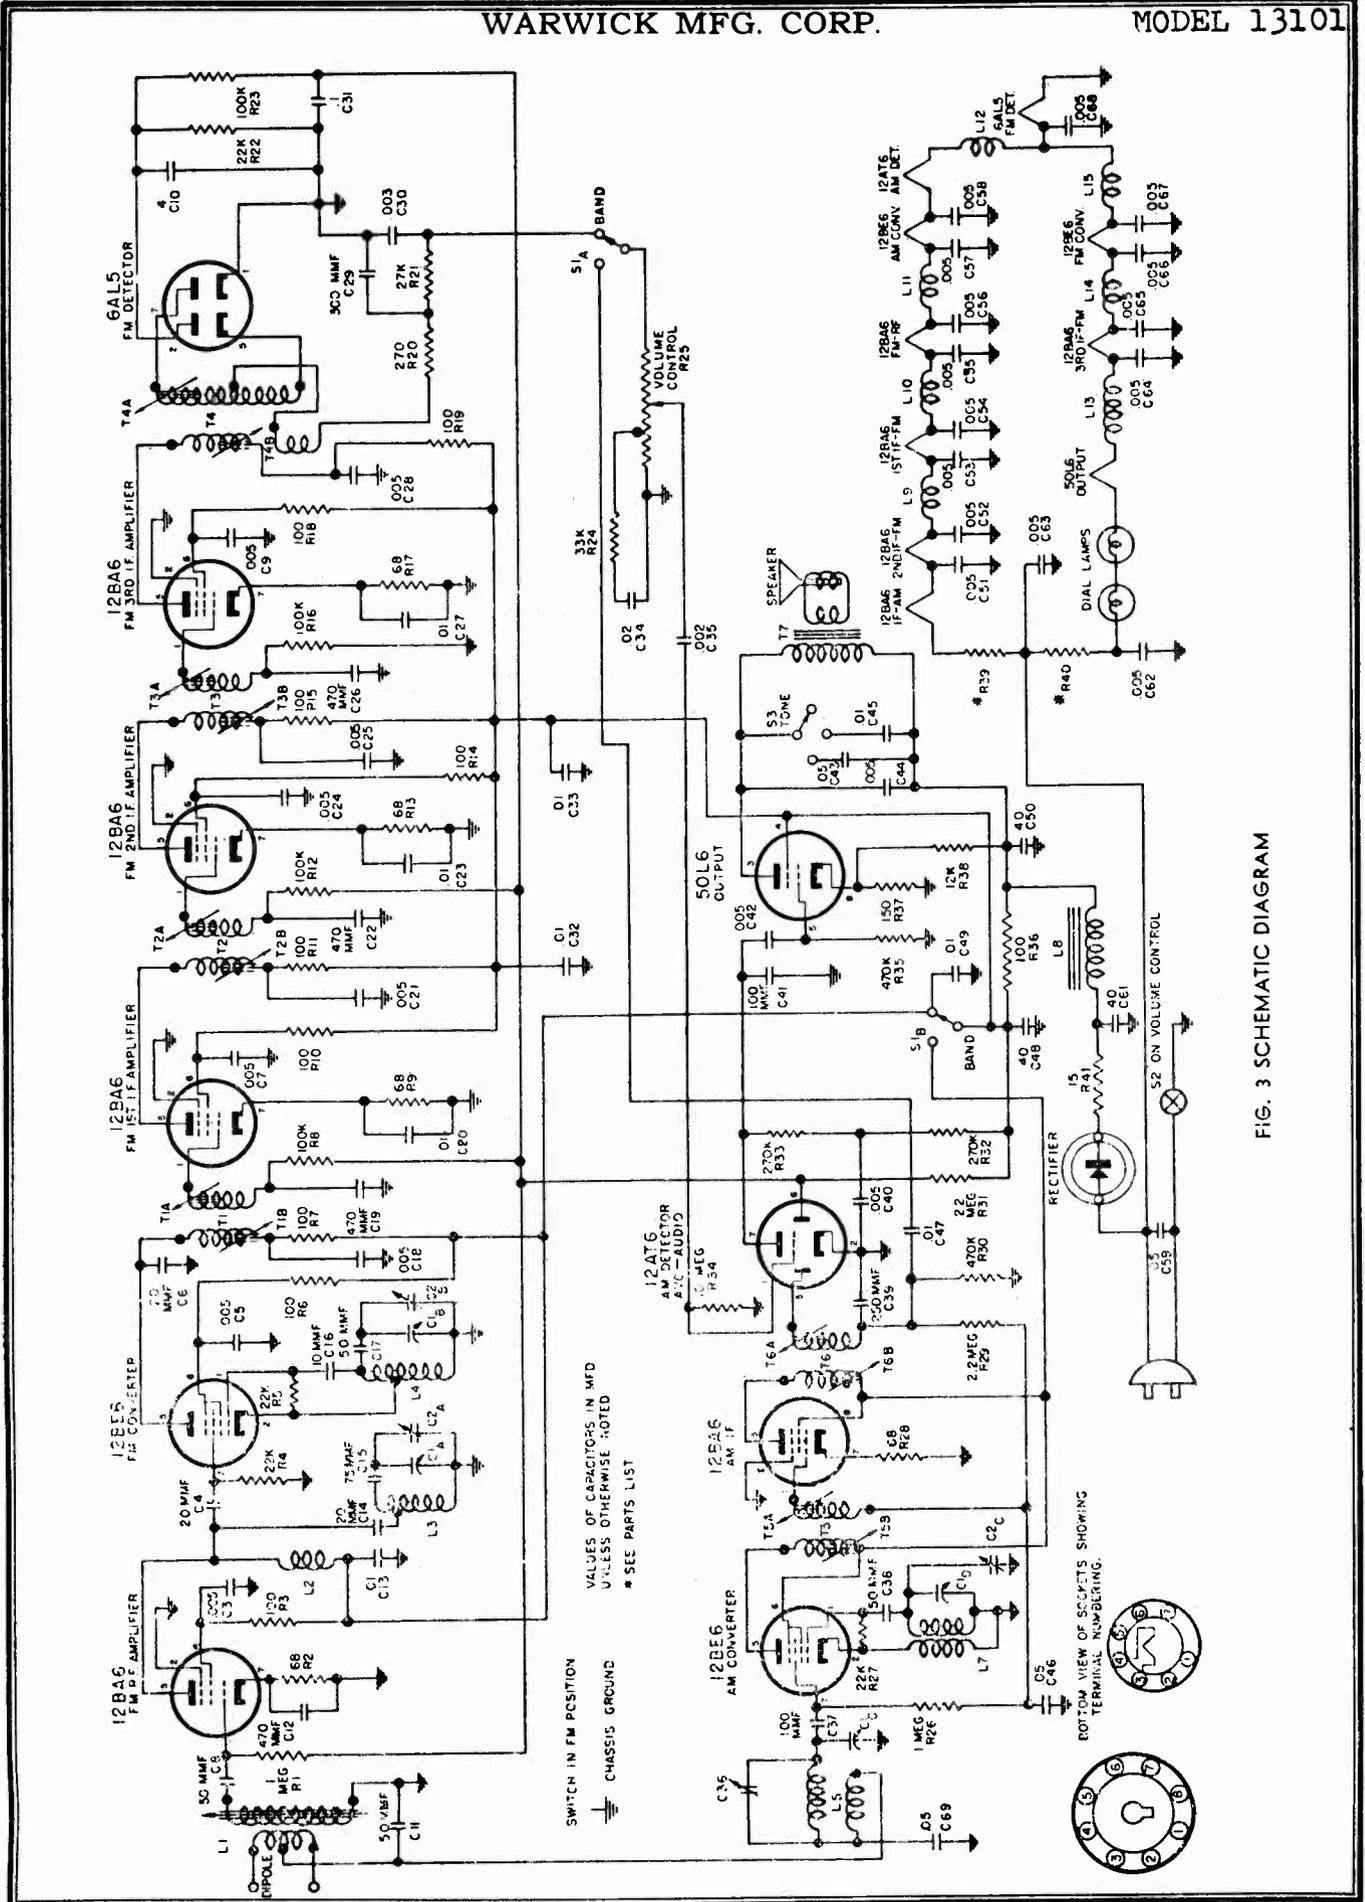

FIG. 3 SCHEMATIC DIAGRAM

SPECIFICATIONS

Power Supply.....	117 volts AC-DC
Power Consumption.....	55 Watts
Frequency Range FM.....	88 to 108 MC.
Frequency Range AM.....	540 to 1600 KC.
I.F. frequency FM.....	10.7 MC.
I.F. frequency AM.....	455 KC.
Band width, FM, Ratio detector.....	360 KC.
Band width, FM, 2nd I.F.....	280 KC.
Band width, FM, 1st I.F.....	240 KC.
Band width, FM, Converter.....	180 KC.
Tubes.....	10
Rectifier.....	Selenium, 150 ma.
Speaker.....	6" P.M.

The tubes used are as follows:

12BA6	FM, R.F. Amplifier
12BE6	FM, Converter
12BA6	FM, 1st I.F. Amplifier
12BA6	FM, 2nd I.F. Amplifier
12BA6	FM, 3rd I.F. Amplifier
6AL5	FM, Ratio detector
12BE6	AM, Converter
12BA6	AM, I.F. Amplifier
12AT6	AM, Detector-AVC-1st audio
50L6GT	Power output
A83-463	Selenium rectifier
No. 47	Pilot lights (2)

GENERAL SERVICE INFORMATION

INSTALLATION

This receiver is shipped from the factory complete with a flexible, folded dipole antenna. This antenna will be satisfactory for good reception under normal conditions. It should be connected to the two (2) dipole terminals on the back of the cabinet, and then extended to its full length. Since FM signals are directional, reception may be sometimes improved by rotating the extended sections of the flexible antenna in different directions.

This antenna is also used in conjunction with the AM antenna coil for standard AM broadcast reception, and therefore must be connected as described above for reception of standard broadcast stations.

When the receiver is to be used under difficult conditions, such as in buildings constructed mainly of steel, or those with steel lath, or, when large buildings, mountains or other objects are between the receiver and the station to be received, it may be necessary to use an external dipole antenna. Remember too, FM reception is limited as to distance and when used outside the primary service area of the transmitter, an outside antenna is very necessary.

The type of dipole to be used depends upon the signal strength of the station in that particular area, as well as conditions of reception as outlined above. There are three types of FM dipole antenna available, the single dipole, the folded dipole, and the non-directional dipole. When the stations to be received are in one general direction, a reflector may be added to either of the first two types to increase their efficiency.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and Oscilloscopes. All I.F. circuit adjustments have been sealed at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given on page 5. This receiver employs the "double peak" type of I.F. circuits, and can not be satisfactorily aligned with conventional AM equipment. Visual alignment procedures must be used.

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.

AM Signal generator

FM Sweep generator.

Oscilloscope.

Insulated screw driver.

Dummy antenna:

All voltage readings are taken from tube pin to chassis.
 All measurements are made with no signal, using a 20,000 ohm per volt meter.
 AC input voltage must be maintained at 117 volts for accurate readings.
 AC voltages shown are at 1000 ohms per volt.
 All voltages shown are approximate.

All resistance readings are taken from tube pin to chassis.
 Due to manufacturing tolerance on component parts, resistance readings may vary as much as 20%.
 All readings are shown in ohms unless otherwise noted.

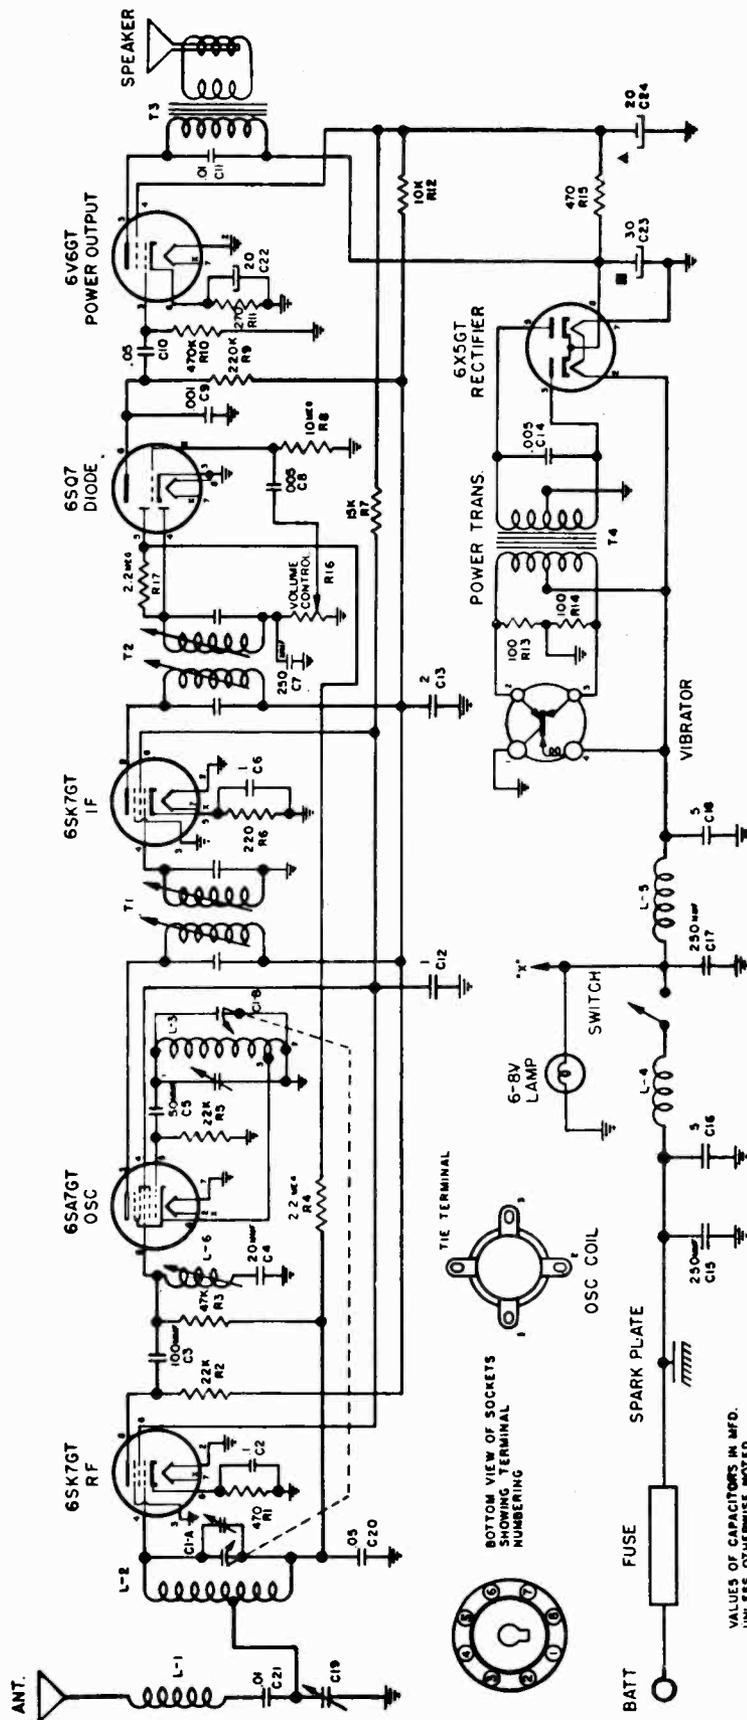

Fig. 3 Schematic Diagram

INSTALLATION

This radio comes to you complete with all hardware necessary for mounting, and also with a distributor suppressor, ammeter condenser and generator condenser. By referring to Figures 1 and 2, and following the instructions outlined below, you will find that it is very simple to install.

First determine where the receiver is to be mounted by holding it with the hands in the approximate location in the car. Using the front mounting bracket as a template, mark and drill two $\frac{5}{8}$ " holes in the instrument panel flange. Now secure the mounting bracket to the radio receiver with the screws provided, and then mount the front of the radio to the instrument panel, using the bolts, lock washers and nuts provided for this purpose. The back of the radio is supported by means of the rear mounting strap. The mounting strap should be formed to the correct angles, as illustrated in Figure 2, so that it can then be fastened to the fire wall. After marking and center-punching the fire wall at the correct location, drill with a $\frac{3}{8}$ " drill. The mounting strap is then secured to the radio and fastened to the fire wall of the car with the $\frac{1}{4}$ " bolt, lock washer and nut furnished with the receiver.

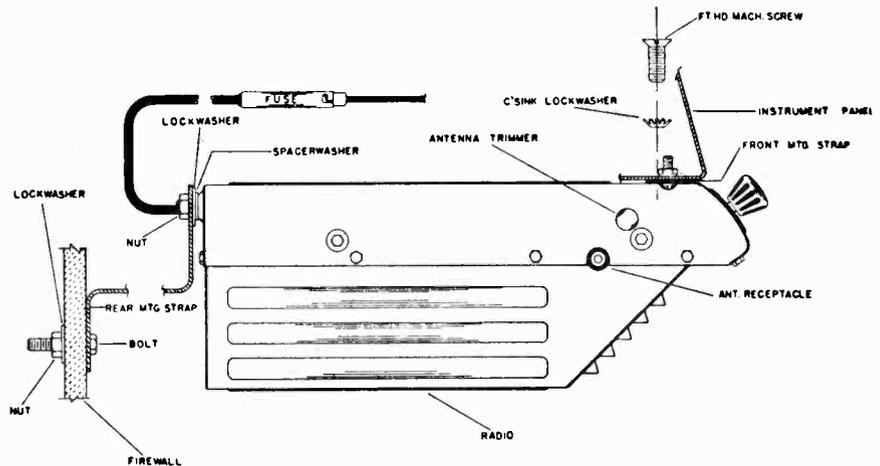

Fig. 2 Side View, Showing Mounting

CONNECTING THE RADIO

The antenna cable should be connected to the radio by inserting the jack into the socket provided on the side of the radio. Connect the battery cable to the hot side of the ammeter behind the instrument panel. The fuse should then be inserted into the cable receptor.

FINAL ADJUSTMENTS

The input circuit has been especially designed to be used with a low capacity antenna, of the fish pole or whip type.

To adjust the antenna trimmer condenser, carefully tune the receiver to a weak station at approximately 600 kilocycles (K.C.). Remove the snap button covering the antenna trimmer (See Figure 2) and adjust the trimmer for maximum volume. A small screw driver will be needed for this purpose.

ACCESSORIES FURNISHED FOR INSTALLATION

All of the parts that are needed for installing this receiver are furnished in the Mounting Parts Kit, part No. S84-192, and the Suppression and Misc. Parts Kit, part No. S84-230, as listed below. Also supplied are the rear mounting strap, part No. B31-134, and the front mounting plate, part No. A31-138.

NOTE: For shipping, the two control knobs have been removed from the tuning and volume control shafts. To install the knobs, line up the flat side of the knob spring, (inside knob) with the flat side of the control shaft and push the knob forward until it stops.

| 1 A81-13 Sleeve (for fuse) | 20" Wire Braid |

ELIMINATING MOTOR NOISE

IMPORTANT: Special care should be taken when mounting the radio to make sure all paint, grease, rust, etc., is removed from all three mounting points. A good electrical contact at these points will aid materially in eliminating motor noise.

GENERATOR CONDENSER

The generator condenser must be connected to the battery terminal of the generator in all cases. If your car is equipped with a generator using an automatic regulator, make sure the condenser IS NOT fastened to the field winding terminal. If in doubt, your local car dealer can advise you as to where the car manufacturer recommends connecting it.

DISTRIBUTOR SUPPRESSOR

Remove the coil to distributor high tension lead from the distributor. Cut the lead two inches from the end, and screw the distributor resistor on to the coil lead, then screw the short length into the resistor and plug the cable into the distributor cap.

AMMETER CONDENSER

A .5 MFD bypass condenser is furnished for attaching to the ammeter. This should be connected to either side of the ammeter with the ground lug fastened to a good ground nearby. In most cases the use of this condenser, the distributor suppressor, and the generator condenser, will eliminate all objectionable ignition interference.

ELECTRICAL ACCESSORIES

In some cases, it may be found that car accessories such as electric heaters, lighters, automatic relays, or gauges, may cause interference while in operation. Proper procedure in such cases is to try another by-pass condenser from ground to the suspected accessory until the source of the interference is found. The condenser then should be permanently mounted in this location.

HIGH AND LOW TENSION LEADS

In many cases the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the

receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. This condition is particularly true on the V-8 Ford, as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

IGNITION COILS

In cars where the ignition coil is located on the back side of the instrument panel it is often necessary to use an additional condenser. It must be installed from the battery side of the ignition coil to the closest ground on the instrument panel.

Short leads are very important. Where coils are mounted either on the instrument panel or in the driver's compartment, it may be necessary to shield the high tension lead from the coil to the distributor.

WHEEL STATIC

Wheel Static is a form of interference caused by the rotation of the front wheels of the car, and it is, of course, only noticed when the car is in motion. If this form of interference is present it can be eliminated by installing wheel static collector springs between the inner hub cap and the spindle shaft.

BONDING OF FIRE WALL TUBES

Bonding the steering column to the fire wall with a short braid may also be effective. Clean the paint from the steering column at the fire wall where the column enters the motor compartment, and solder on a short piece of braid. Ground the end of the braid to the fire wall.

In some cases it may be necessary to ground the tubes and rods coming through the fire wall in order to reduce the interference. Clean them with emery cloth and spot-solder the braid, fastening the end under a convenient screw. A 1/4" piece of wire braid 20 inches long is furnished in the suppression kit assembly for this purpose.

ALIGNMENT PROCEDURE

- Volume control—Maximum, all adjustments.
 No signal applied to antenna.
 Power input—6.3 volts.
 Connect dummy antenna in series with output lead of signal generator.
 Connect output meter across voice coil.
 Connect ground lead of signal generator to chassis.
 Repeat alignment procedure as a final check.
- The following equipment is necessary for proper alignment:
 Signal generator that will provide the test frequencies as listed.
 Non-metallic screwdriver.
 Output meter.
 Dummy antennas—.1 MFD., .00025 MFD.
 For alignment points refer to Figures 4 and 5.

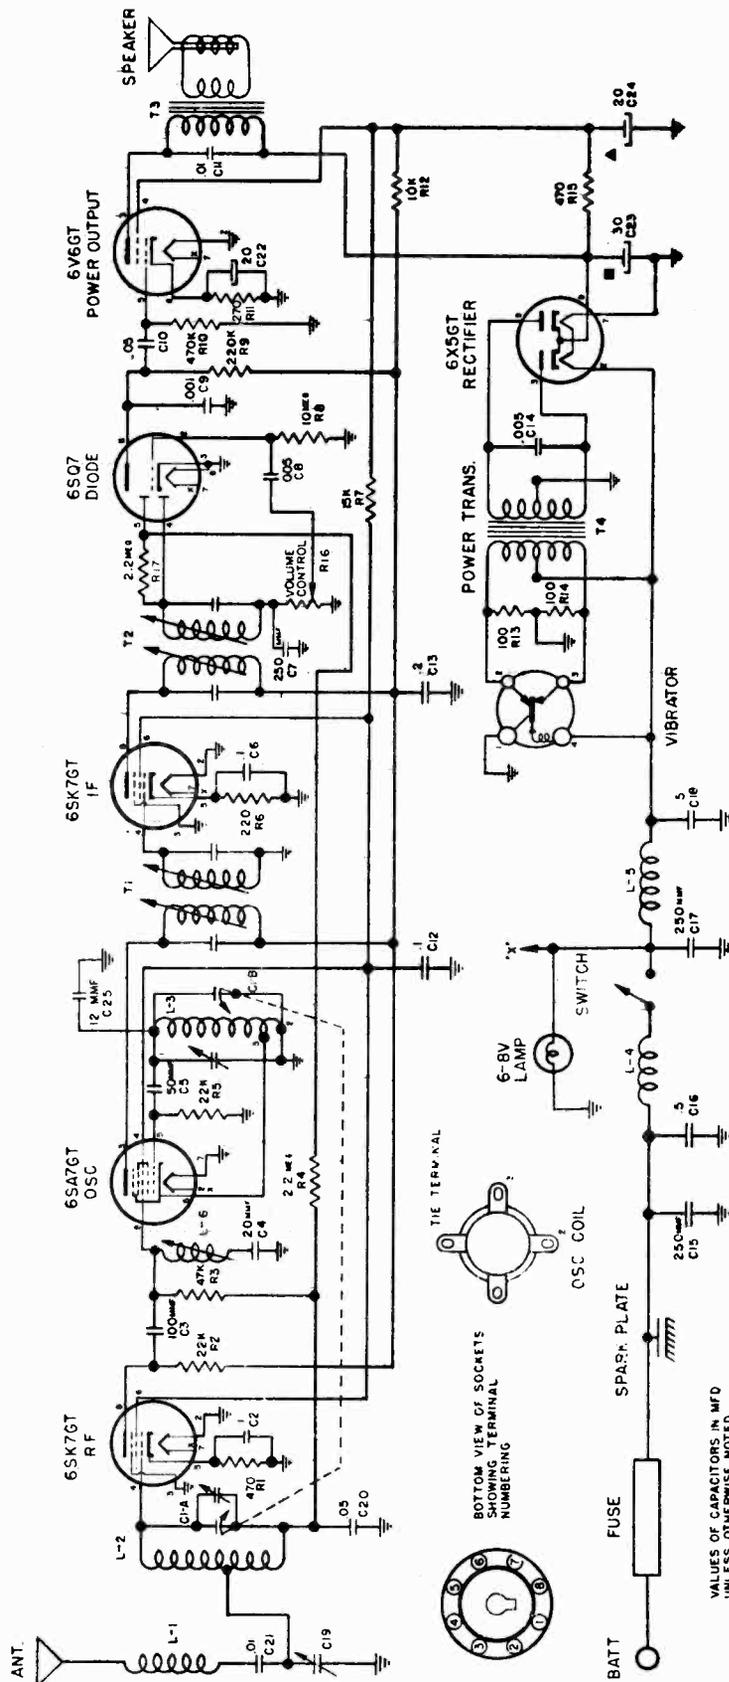

Fig. 3 Schematic Diagram

INSTALLATION

This radio comes to you complete with all hardware necessary for mounting, and also with a distributor suppressor, ammeter condenser and generator condenser. By referring to Figures 1 and 2, and following the instructions outlined below, you will find that it is very simple to install.

First determine where the receiver is to be mounted by holding it with the hands in the approximate location in the car. Using the front mounting bracket as a template, mark and drill two $\frac{5}{8}$ " holes in the instrument panel flange. Now secure the mounting bracket to the radio receiver with the screws provided, and then mount the front of the radio to the instrument panel, using the bolts, lock washers and nuts provided for this purpose. The back of the radio is supported by means of the rear mounting strap.

The mounting strap should be formed to the correct angles, as illustrated in Figure 2, so that it can then be fastened to the fire wall. After marking and center-punching the fire wall at the correct location, drill with a $\frac{3}{8}$ " drill. The mounting strap is then secured to the radio and fastened to the fire wall of the car with the $\frac{1}{4}$ " bolt, lock washer and nut furnished with the receiver.

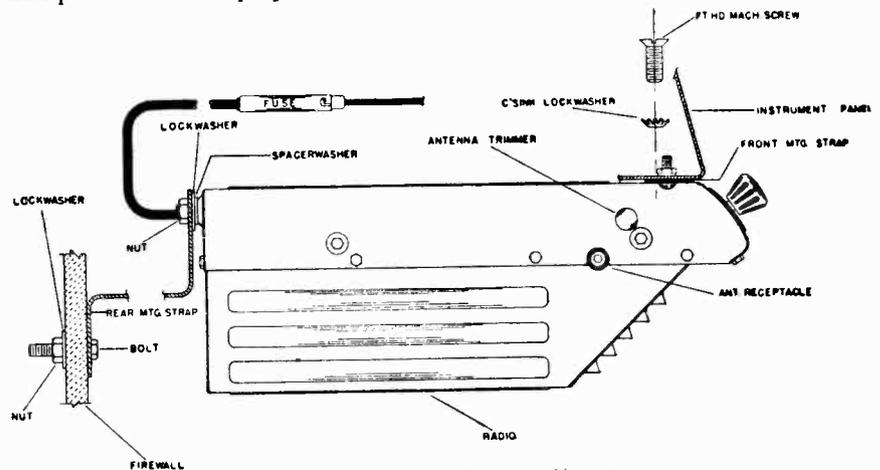

Fig. 2 Side View, Showing Mounting

CONNECTING THE RADIO

The antenna cable should be connected to the radio by inserting the jack into the socket provided on the side of the radio. Connect the battery cable to the hot side of the ammeter behind the instrument panel. The fuse should then be inserted into the cable receptor.

FINAL ADJUSTMENTS

The input circuit has been especially designed to be used with a low capacity antenna, of the fish pole or whip type.

To adjust the antenna trimmer condenser, carefully tune the receiver to a weak station at approximately 600 kilocycles (K.C.). Remove the snap button covering the antenna trimmer (See Figure 2) and adjust the trimmer for maximum volume. A small screw driver will be needed for this purpose.

ACCESSORIES FURNISHED FOR INSTALLATION

All of the parts that are needed for installing this receiver are furnished in the Mounting Parts Kit, part No. S84-192, and the Suppression and Misc. Parts Kit, part No. S84-230, as listed below. Also supplied are the rear mounting strap, part No. B31-134, and the front mounting plate, part No. A31-138.

NOTE: For shipping, the two control knobs have been removed from the tuning and volume control shafts. To install the knobs, line up the flat side of the knob spring, (inside knob) with the flat side of the control shaft and push the knob forward until it stops.

ELIMINATING MOTOR NOISE

IMPORTANT: Special care should be taken when mounting the radio to make sure all paint, grease, rust, etc., is removed from all three mounting points. A good electrical contact at these points will aid materially in eliminating motor noise.

GENERATOR CONDENSER

The generator condenser must be connected to the battery terminal of the generator in all cases. If your car is equipped with a generator using an automatic regulator, make sure the condenser IS NOT fastened to the field winding terminal. If in doubt, your local car dealer can advise you as to where the car manufacturer recommends connecting it.

DISTRIBUTOR SUPPRESSOR

Remove the coil to distributor high tension lead from the distributor. Cut the lead two inches from the end, and screw the distributor resistor on to the coil lead, then screw the short length into the resistor and plug the cable into the distributor cap.

AMMETER CONDENSER

A .5 MFD bypass condenser is furnished for attaching to the ammeter. This should be connected to either side of the ammeter with the ground lug fastened to a good ground nearby. In most cases the use of this condenser, the distributor suppressor, and the generator condenser, will eliminate all objectionable ignition interference.

ELECTRICAL ACCESSORIES

In some cases, it may be found that car accessories such as electric heaters, lighters, automatic relays, or gauges, may cause interference while in operation. Proper procedure in such cases is to try another by-pass condenser from ground to the suspected accessory until the source of the interference is found. The condenser then should be permanently mounted in this location.

HIGH AND LOW TENSION LEADS

In many cases the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the

receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. This condition is particularly true on the V-8 Ford, as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

IGNITION COILS

In cars where the ignition coil is located on the back side of the instrument panel it is often necessary to use an additional condenser. It must be installed from the battery side of the ignition coil to the closest ground on the instrument panel.

Short leads are very important. Where coils are mounted either on the instrument panel or in the driver's compartment, it may be necessary to shield the high tension lead from the coil to the distributor.

WHEEL STATIC

Wheel Static is a form of interference caused by the rotation of the front wheels of the car, and it is, of course, only noticed when the car is in motion. If this form of interference is present it can be eliminated by installing wheel static collector springs between the inner hub cap and the spindle shaft.

BONDING OF FIRE WALL TUBES

Bonding the steering column to the fire wall with a short braid may also be effective. Clean the paint from the steering column at the fire wall where the column enters the motor compartment, and solder on a short piece of braid. Ground the end of the braid to the fire wall.

In some cases it may be necessary to ground the tubes and rods coming through the fire wall in order to reduce the interference. Clean them with emery cloth and spot-solder the braid, fastening the end under a convenient screw. A 1/4" piece of wire braid 20 inches long is furnished in the suppression kit assembly for this purpose.

ELECTRICAL SPECIFICATIONS

Power Supply.....	6.3 volts DC
Current.....	4.8 amp. average
Frequency Range.....	540 to 1600 KC
I. F. Frequency.....	455 KC
Speaker.....	4" P. M.
Power Output.....	1.2 watts, undistorted 2.5 watts, maximum
Sensitivity.....	10 microvolts average for 1 watt output
Selectivity.....	20 KC broad at 1000 times signal, at 1000 KC

SERVICE NOTES

Volts taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets, no signal applied, and with a volt meter having a resistance of 20,000 ohms per volt. These voltages are clearly shown on the voltage chart, (Fig. 4).

All voltages should be measured with an input voltage of 6.3 volts DC.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTION

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE". After realignment has been completed repeat the procedure as a final check.

The tube compliment of this receiver is as follows:

- 1—6SK7GT—R. F. Amplifier.
- 1—6SA7GT—Converter.
- 1—6SK7GT—I.F. Amplifier.
- 1—6SQ7—Detector—AVC—1st audio.
- 1—6V6GT—Power output.
- 1—6X5GT—Rectifier.

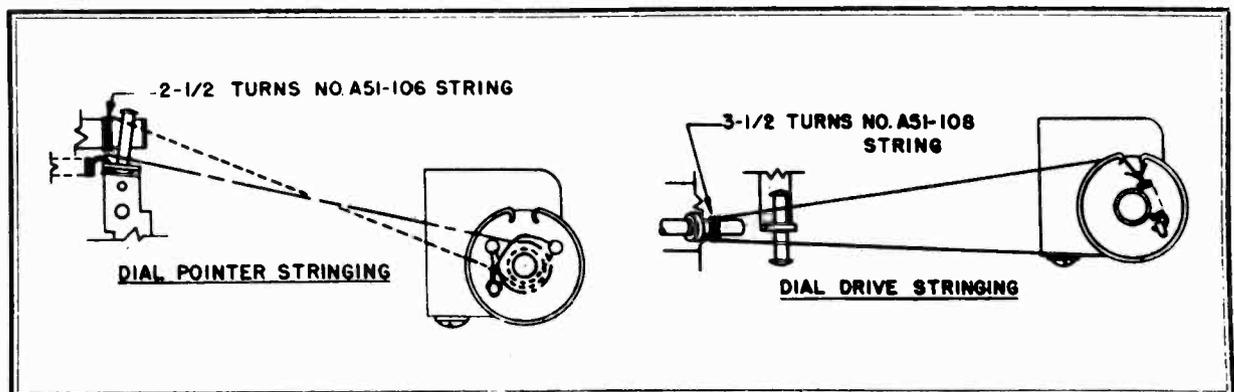

INSTRUCTIONS FOR REMOVING CHASSIS FROM THE CASE

The bottom cover (the one with the speaker louvers) can be removed to permit servicing of major components, such as tubes and vibrator, by removing the eight (8) screws holding it to the top cover. There are three (3) screws on each side, one (1) in the rear, and one (1) in the front.

CAUTION: Before attempting to remove the top cover, to service condensers, resistors, etc., the screw connecting the spark plate to the "A" terminal (inside case) must be removed. This is a round head screw, and is located on the rear of the case, close to the mounting stud bolt. It is recessed in a 1/2 inch hole in the case itself, thereby permitting contact with the spark plate.

After removing the spark plate screw, remove the two knobs by pulling forward and remove the eight (8) screws securing the cover to the chassis. Lift the chassis at the rear, at the same time moving it away from the front of the case so that the volume and tuning shafts will clear the holes in the cover.

NOTE: When reinstalling the chassis into the case, be sure the screw connecting the spark plate to the "A" terminal (inside case) is tightened very securely, otherwise the receiver will not operate properly.

MODEL 14515

WARWICK MFG. CORP.

ALIGNMENT PROCEDURE

The following equipment is necessary for proper alignment:

- Signal generator that will provide the test frequencies as listed.
- Non-metallic screwdriver.
- Output meter.
- Dummy antennas—.1 MFD., .00025 MFD.

For alignment points refer to Figures 4 and 5.

Volume control—Maximum, all adjustments.
 No signal applied to antenna.
 Power input—6.3 volts.
 Connect dummy antenna in series with output lead of signal generator.
 Connect output meter across voice coil.
 Connect ground lead of signal generator to chassis.
 Repeat alignment procedure as a final check.

I.F. = 455 Kc

1. Connect a signal generator through a .1 Mfd. condenser to Pin 8 of the 12SA7. With only enough signal to give a good indication, peak the IF trimmers at 455Kc.
2. With the generator connected to a transmitting loop near the receiver, peak the osc. trimmer at 1620 Kc. with the receiver gang full open. Next, set the signal generator at 1400 Kc. and tune in this signal on the receiver. Peak the antenna trimmer.

MODELS 4800,
4802

WATTERSON RADIO MFG. CORP.

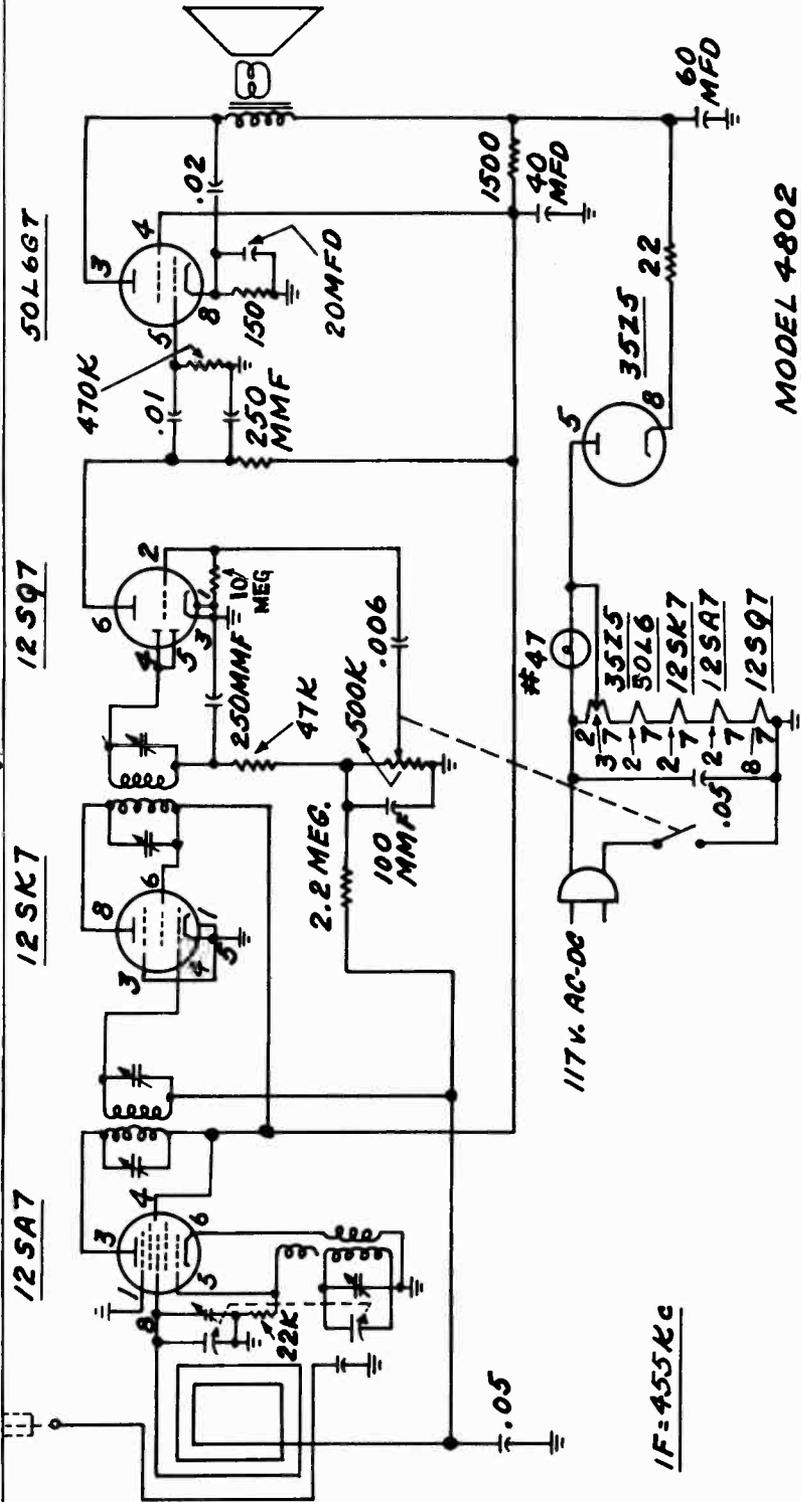

Use an unmodulated signal and tune for minimum noise in all FM adjustments.

FM Alignment:

MODEL 4800
AM/FM

1. Connect a signal generator to the FM ant. terminals. Using a 21.75 Mc. signal, tune the IF slug adjustment for minimum noise making sure slug is at the tuning point nearest top of can. There is another tuning point with the slug screwed farther down into the coil which produces unwanted coupling.

2. With a 150 ohm resistor in each lead, connect a high frequency generator to the FM ant. Terminals. Set ant. trimmer to maximum capacity. Use enough signal to give a definite dip in noise but do not block the receiver. Set the osc. section to track from 87.5 Mc. to 108.5 Mc. by trimming on the high end and adjusting the osc. coil spacing on the low end. Check each of these adjustments several times. Next, with the generator set at 103 Mc. Tune in this signal on the receiver. While rocking the dial slightly, tune the ant. trimmer for minimum noise. Use an insulated screw driver on all RF adjustments.

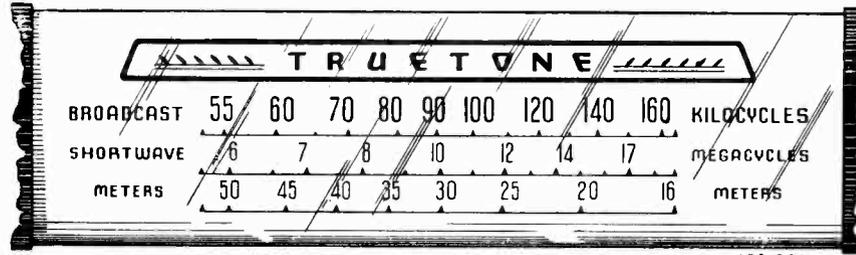

MODEL 4802

SHORT WAVE BAND

5.75 to 18.3
Megacycles

This band is calibrated in both megacycles and meters. The principal international short wave stations will be found in the 16, 19, 25, 31 and 49 meter bands.

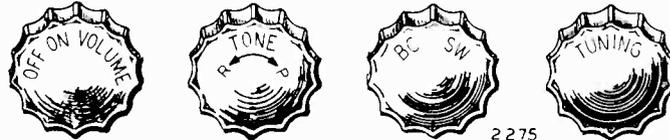

A86-2274

BROADCAST BAND

540 to 1600

← Kilocycles

This band is calibrated in channel numbers. Add a zero to the dial number to get the kilocycle number.

ON-OFF SWITCH AND VOLUME CONTROL

Turn radio on by turning knob to the right. A click will be heard—wait 30 seconds for tubes to heat. Continuing to turn the knob to the right will increase the volume.

TUNING KNOB

Turn until desired station is heard. Then slowly rotate back and forth until signal is clearest and strongest. If signal is too strong, reduce it by means of the volume control, not by using the tuning knob.

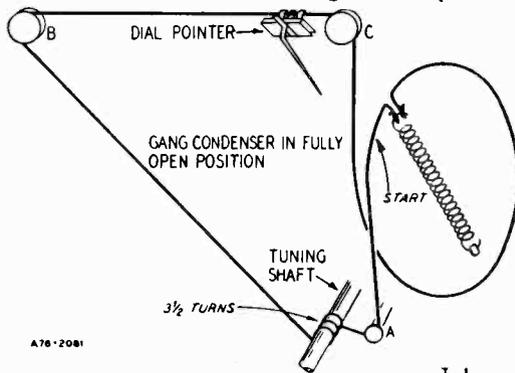

TONE CONTROL AND PHONO-RADIO SWITCH

PHONO-RADIO SWITCH—For radio reception, turn knob completely to the left. A click will be heard, if the knob was in the phono position. For phonograph reproduction, turn knob completely to the right. (See page 2 for Record Player Connections). A click will be heard, if the knob was in the radio position.

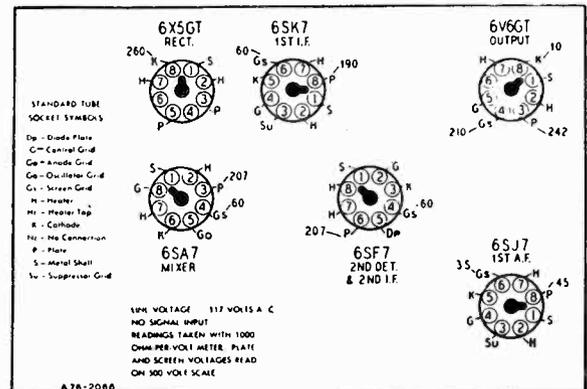

TONE CONTROL—When knob is turned to the right, a brilliant tone is obtained and when turned to the left, a deep bass effect is produced. Do not turn knob past the stop position when adjusting the tone or the position of the Phono-Radio Switch will be changed as explained above.

BAND SWITCH

This knob has two positions. The position to the left provides reception on the standard Broadcast Band. The position to the right switches the tuning to the Short Wave Band.

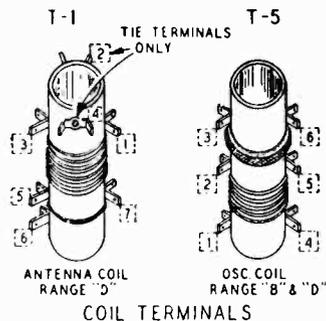

A76-2081

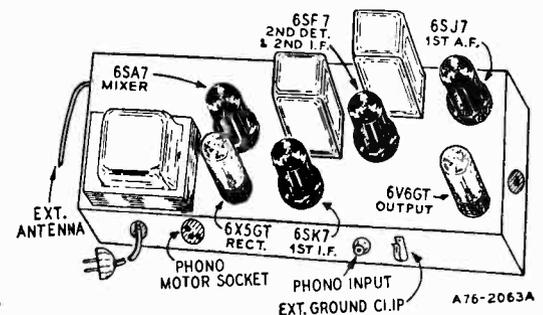

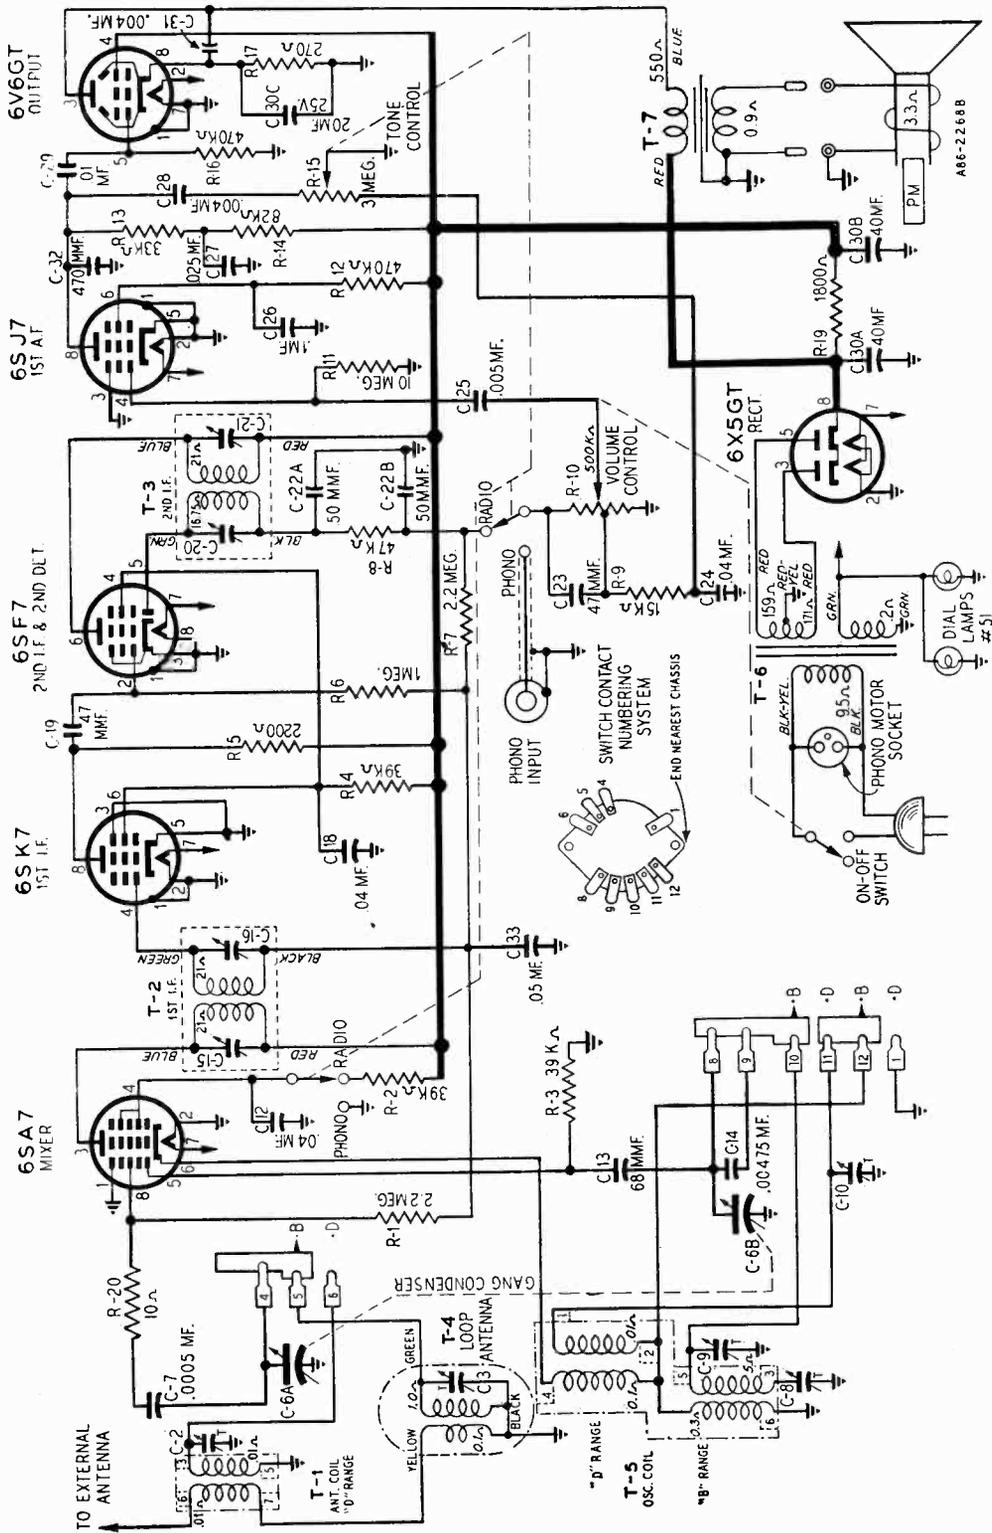

DRIVE CORD REPLACEMENT

The drive cord should be replaced as shown on the accompanying illustration using a new 10X66 drive cord assembly for the purpose. After the cord has been installed, stretch the tension spring and fasten the free end of the cord to it.

A86-2262

WESTERN AUTO SUPPLY CO.

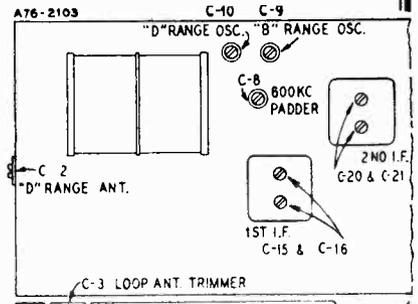

MODEL D1835B

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 50 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C20) & (C21)
RANGE B	1620 KC	Antenna Lead	50 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B (C3)
	600 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	600 KC (C8) See Note B
Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement in output.						
RANGE D	18.3 MC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	16 MC	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Ant. Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	1400 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B (C3) See Note A

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn rotor back and forth and adjust the trimmer until peak of greatest intensity is obtained.

The dial lamp socket assemblies may be disengaged from the cabinet mounting by squeezing together and pulling away from the cabinet mounting, the spring bracket to which the dial lamp socket is mounted. Take care not to bend or damage the large drive pulley on the gang condenser while doing this.

When replacing the chassis in the cabinet it will be necessary to tune in a station of a known frequency and move the dial pointer until that frequency is indicated on the dial and then attach the pointer to the dial string. Take care not to scuff or cut the dial string or bend the pointer during this operation.

SPECIFICATIONS

Power Consumption	45 Watts
	(At 117 volts AC)

TUBE COMPLEMENT

The tube complement of this receiver consists of the following:

- 1—6SK7—R.F. Amplifier
- 1—6SA7—Mixer—OSC.
- 1—6SK7—I.F. Amplifier
- 1—6SQ7—Det. AVC—Audio
- 1—6K6—Power Output
- 1—5Y3—Rectifier

SOCKET VOLTAGES

All voltages are measured with a 1000 ohm per volt meter on the 150 volt scale, with no signal. To obtain an accurate voltage check the A.C. line voltage must be 117 volts. Where no voltage is shown the voltage is 0 or cannot be read with this type of voltmeter.

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets and with a volt meter having a resistance of 1000 ohms per volt, using the 150 volt scale. These voltages are clearly indicated on the voltage chart. (Fig. 2).

All voltages should be measured with an A.C. line voltage of 117 volts.

To check for open bypass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTIONS

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered

with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE" on the next page. After realignment has been completed repeat the procedure as a final check.

REMOVING CHASSIS FROM CABINET

The dial pointer must be removed from the pointer rail assembly, and cabinet before the chassis can be taken from the cabinet. This can be done by detaching the dial cord from the pointer and sliding the pointer to the right (viewed from the rear of the cabinet) as far as it will go. The dial pointer can now be removed from the cabinet.

The chassis can now be removed in the conventional manner by taking out the four chassis mounting bolts after disconnecting the speaker and phono leads.

ALIGNMENT PROCEDURE

Volume control—Maximum: all adjustments.
 Tone Control—Treble: Full Clockwise Rotation.
 Connect ground lead of signal generator to radio chassis.
 Connect dummy antenna in series with output lead of signal generator.
 Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment
 Signal generator that will provide the test frequencies as listed.
 Output meter.
 Non-metallic screwdriver.
 Dummy antennas—.1 mfd., .00025 mfd.

Position of Variable	Generator Frequency	Dummy Ant. mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Minimum Capacity (Fully Opened)	455 K.C.	.1	6SA7 Grid (Stator of C1B)	T1 T2	I. F.
Minimum Capacity (Fully Opened)	1725 K.C.	.00025	*Ant. Terminal on Loop	C1C	Osc.
Tune in signal From Generator	1500 K.C.	.00025	*Ant. Terminal on Loop	C1B	R. F.
Tune in signal From Generator	1500 K.C.	.00025	*Ant. Terminal on Loop	C1A	Ant.

*Be sure coupling link is in correct position for external antenna operation. See illustration below (Fig. 4).

With an output meter connected across the voice coil of the speaker, the output meter reading for 1/2 watt is 1.25 volts using a signal which is modulated 400 c.p.s.

Repeat the above alignment procedure as a final check.

ELECTRICAL SPECIFICATIONS

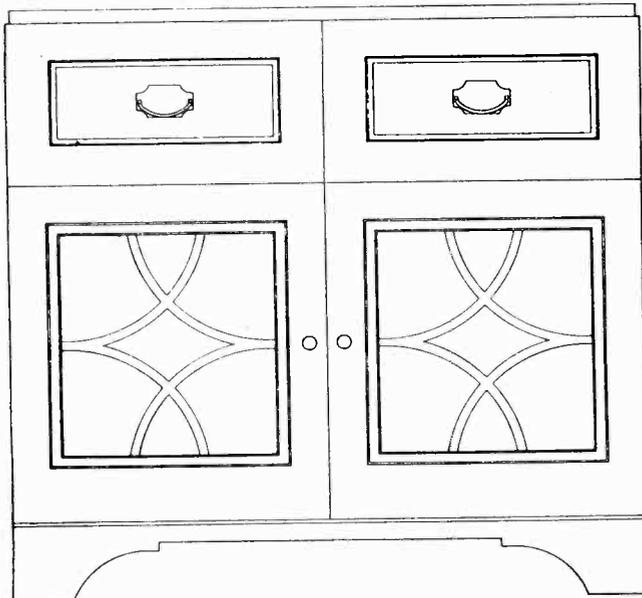

Power Supply.....105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.
Frequency Range...Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.
Intermediate Freq....AM-455 kc; FM-10.7 mc.
Selectivity.....AM-48 kc. broad at 1000 times signal, measured at 1000 kc. I.F. FM-180 kc. broad at 2 times down. I.F. FM-320 kc. broad at 10 times down.
AM Sensitivity.....(For .5 watt output with external antenna)—3 microvolts average.
FM Sensitivity.....(For .5 watt output)—10 microvolts average.
Power Output.....8 watts. 10% distortion. 10 watts maximum.

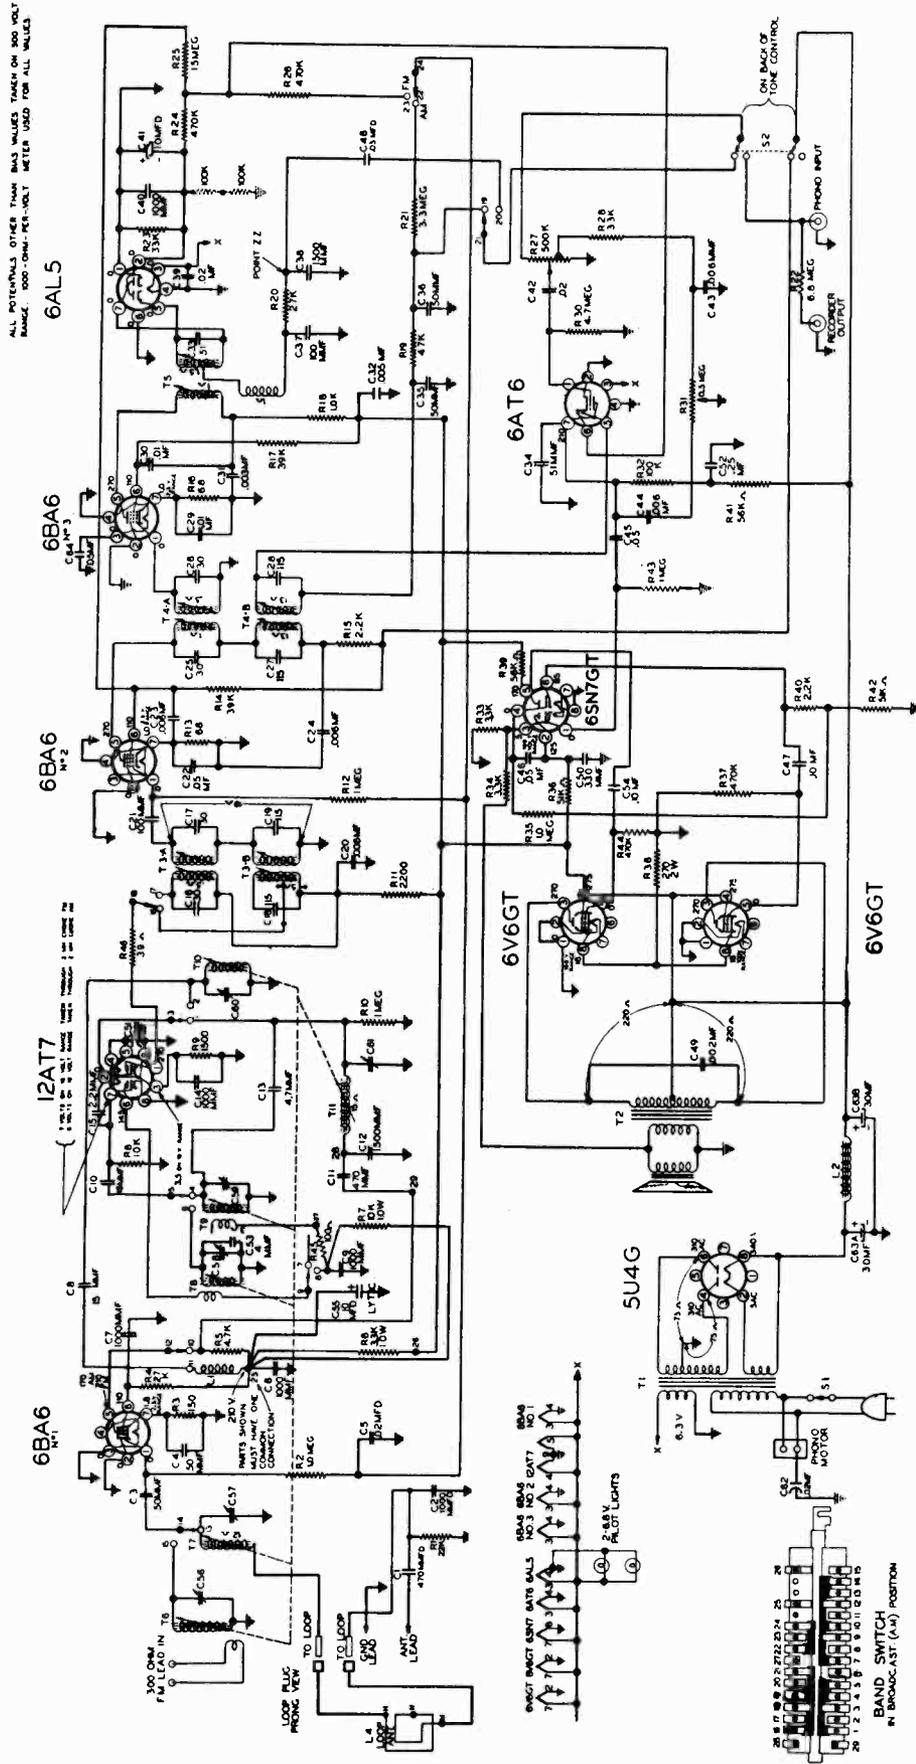

Loud Speaker.....12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.
Tube and Lamp Complement.....6BA6, FM—AM R.F. stage. 12AT7, FM—AM oscillator and mixer. 6BA6, FM—AM—1st I.F. 6BA6, FM—2nd I.F. 6AL5, FM—ratio detector. 6AT6, AM detector. A. F. AMP. and A.V.C. 6SN7, Push-Pull. Driver and phase-inverter. 5U4G, rectifier. 6V6, output. 6V6, output. T-44 dial lamp (2 used).
Automatic changer..Oak 6666 with P-93 Cartridge.

TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1 1/2 inches. "Y" should be 1-1/32 inches. "X" is from the end of the slug to edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM Band. No slug adjustment should be necessary since the slugs are properly set at the factory.

NOTE: Two 100K ohm resistors in series from Pin No. 2 of the 6AL5 to ground are connected as shown only when aligning the FM I. F. Refer to FM I. F. alignment procedure.

NOTE: B.C. Oscillator Coil T9 and number 7 terminal of slide switch should be connected together.

NOTE: Resistor R22 removed; with shielded wire from recorder output jack to radio side of radio-phonos switch S2 added.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of 1/2 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a 1/2-watt output with the speaker con-

nected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

A M - I . F . ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

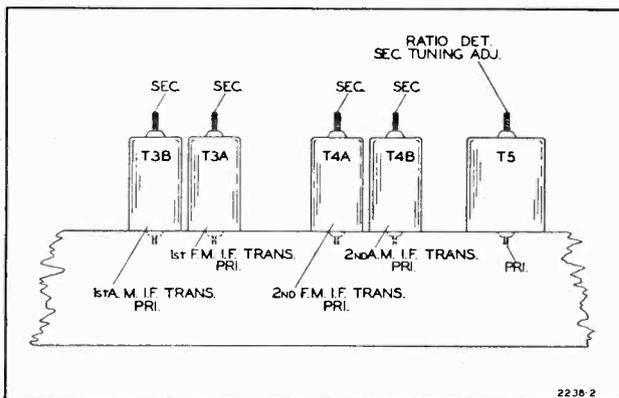

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4B AM windings See I. F. view	Maximum output Should be 1/2 watt.
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3B AM windings See I. F. view	Maximum output Should be 1/2 watt.
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be 1/2 watt.

BROADCAST BAND - R . F . ALIGNMENT

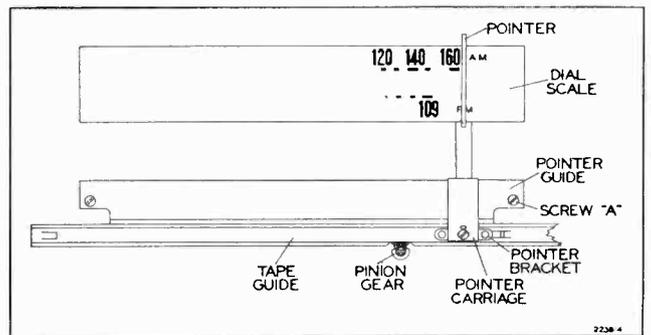

Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.

For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQ.	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C59, C57, C61. For maximum, 1/2 watt

I. F. VIEW

DIAL ADJUSTMENT VIEW

Loosen screw "A" so that teeth of tape can be properly meshed with pinion gear to give proper pointer travel.

ALIGNMENT PROCEDURE

FM Band Section I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT— No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio

are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE— The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other

words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENT TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	See note "A"	Secondary of T5	Resonance should be about 3 volts
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T4A 10.7 m.c. windings See I.F. view	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3A See I.F. view	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-

point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.

For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R. F. C56 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter

as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

ELECTRICAL SPECIFICATIONS

Power Consumption—
117 volts AC 60 watts normal
85 watts phono operating

Power Output—
4.5 watts maximum
2.5 watts 10% distortion

Speaker—8" PM dynamic

Frequency Ranges—
Broadcast 540-1600 KC
Frequency Modulation 88-108 MC

Intermediate Frequency—
AM 455 KC — FM 10.7 MC

Selectivity — AM — 45 KC broad
at 1000 times signal, measured
at 1000 KC

I.F. FM—200 KC broad at 2 times
down

I.F. FM—950 KC broad at 200
times down

AM Sensitivity—(For .5 watt output
with external antenna)
10 microvolts average

FM Sensitivity—(For .5 watt output)
100 microvolts average

REMOVAL OF CHASSIS FROM CABINET

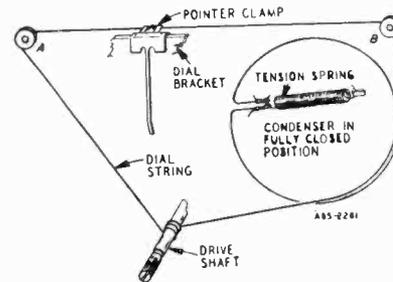

Before removing the chassis from the cabinet it will be necessary to detach the dial pointer from the dial string. To do this, spread the tabs on the pointer and pull the dial string off the pointer.

The dial lamp socket assembly may be disengaged from the cabinet mounting by squeezing together and pulling away from the cabinet mounting, the spring bracket to which the dial lamp socket is mounted. Take care not to bend or damage the large drive pulley on the gang condenser while doing this.

When replacing the chassis in the cabinet it will be necessary to tune in a station of a known frequency and move the dial pointer until that frequency is indicated on the dial and then attach the pointer to the dial string. Take care not to scuff or cut the dial string or bend the pointer during this operation.

DRIVE CORD REPLACEMENT

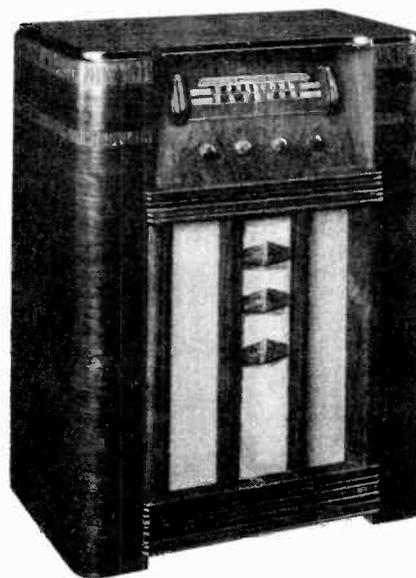

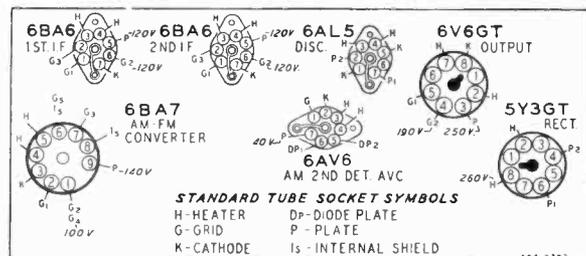

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

TUBE SOCKET VOLTAGES

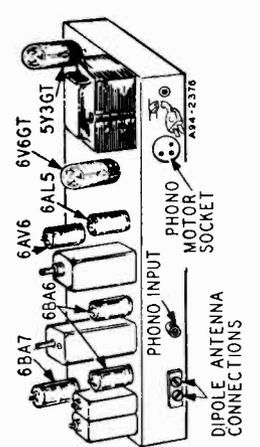

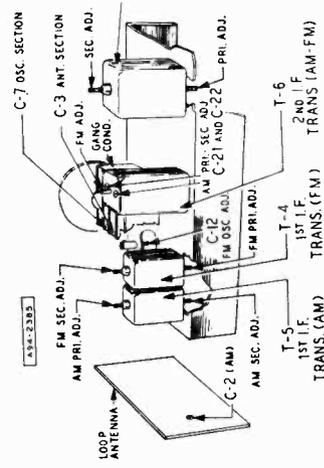

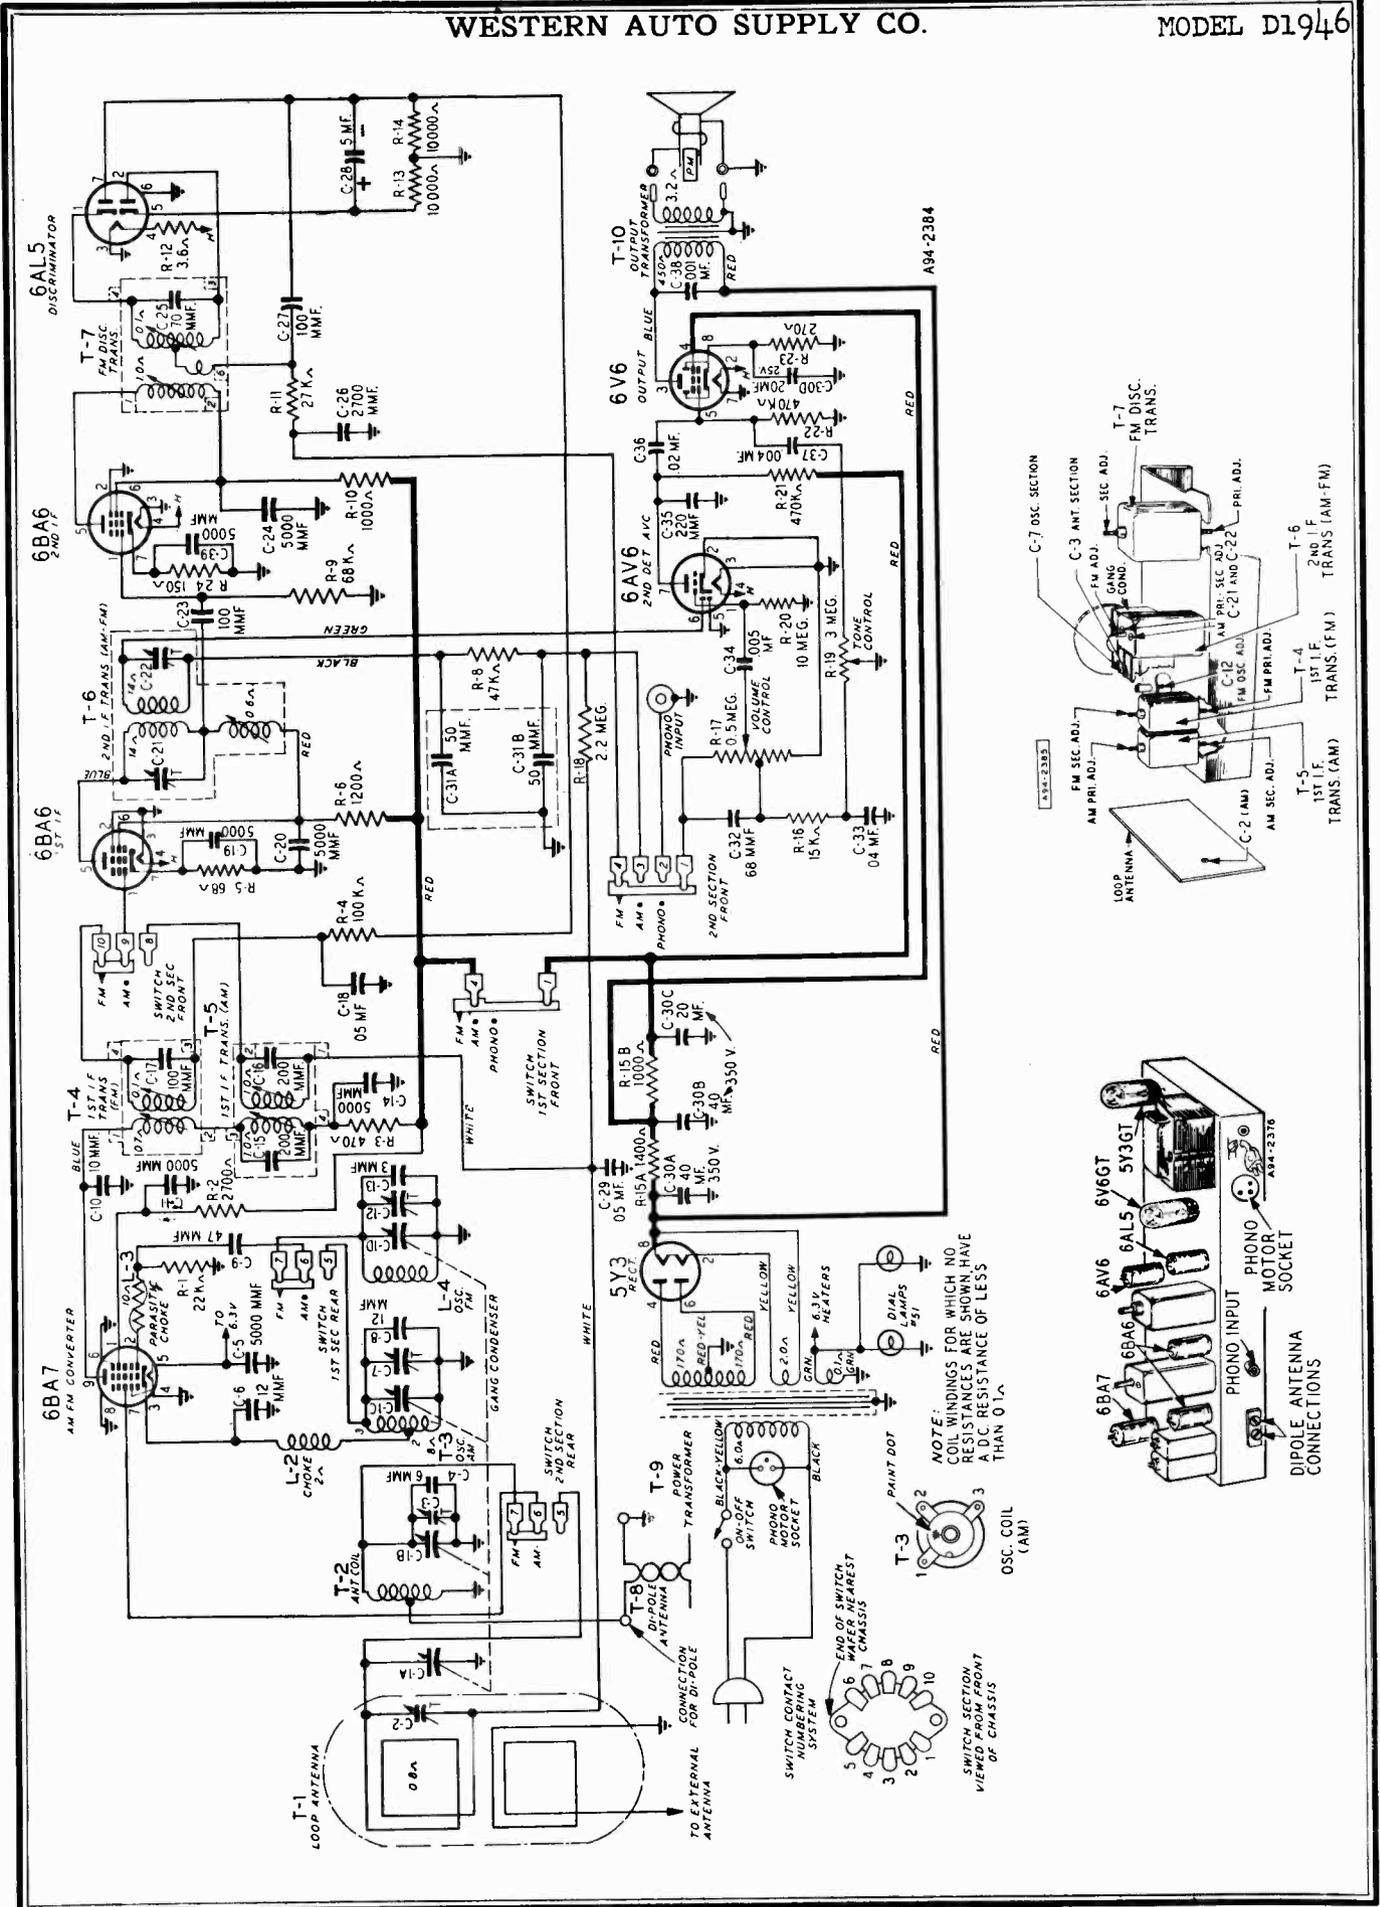

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

- Line voltage117 Volts AC
- Signal InputNone
- A Variation of $\pm 10\%$ is usually permissible.

WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURES**AM STAGES**

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS AND TRIMMERS
455 KC	Control Grid 1st 6BA6 Pin No. 1	Chassis Base	.1 mf	Turn Rotor to Full Open	2nd I.F. C-21 & C-22
455 KC	Control Grid 6BA7 Pin No. 7 1st Def.	Same as above	.1 mf	Turn Rotor to Full Open	1st I.F. Pri. & Sec.
1620 KC	Control Grid 6BA7 Pin No. 7	Same as above	.1 mf	Turn Rotor to Full Open	Oscillator C-7
1400 KC	External Antenna Lead	Same as above	50 mmf	Turn Dial to 1400 KC. See Note A	Antenna C-2

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

FM STAGES

Allow chassis and signal generator to warm up for several minutes.

The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms and a 3300 ohm .5 watt resistor with short leads.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

Antenna	104.5	Same as above	300 ohms	FM	Tune rotor for max. AVC voltage	Ant. C-3

RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN**FM ALIGNMENT NOTES**

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.

Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it to the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I-F Trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

ELECTRICAL SPECIFICATIONS

- Power Supply**.....105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.
- Frequency Range**...Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.
- Intermediate Freq.**...AM-455 kc; FM-10.7 mc.
- Selectivity**.....AM-48 kc. broad at 1000 times signal, measured at 1000 kc. I.F. FM-180 kc. broad at 2 times down. I.F. FM-320 kc. broad at 10 times down.
- AM Sensitivity**.....(For .5 watt output with external antenna)—3 microvolts average.
- FM Sensitivity**.....(For .5 watt output)—10 microvolts average.
- Power Output**.....8 watts. 10% distortion. 10 watts maximum.

- Loud Speaker**.....12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.
- Tube and Lamp Complement**.....6BA6, FM—AM R.F. stage. 12AT7, FM—AM oscillator and mixer. 6BA6, FM—AM—1st I.F. 6BA6, FM—2nd I.F. 6AL5, FM—ratio detector. 6AT6, AM detector. A. F. AMP. and A.V.C. 6SN7, Push-Pull. Driver and phase-inverter. 5U4G, rectifier. 6V6, output. 6V6, output. T-44 dial lamp (2 used).

Chassis — top view

NOTE: Two 100K ohm resistors in series from Pin No. 2 of the 6AL5 to ground are connected as shown only when aligning the FM I. F. Refer to FM I. F. alignment procedure.

NOTE: B.C. Oscillator Coil T9 and number 7 terminal of slide switch should be connected together.

NOTE: A 3.3 ohm resistor C-9B1-1069 is connected between Pin 3 of 6AL5 and the filament line (X) in some productions.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of 1/2 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a 1/2-watt output with the speaker con-

nected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM-I.F. ALIGNMENT

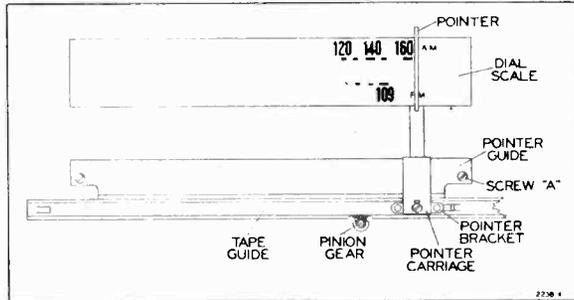

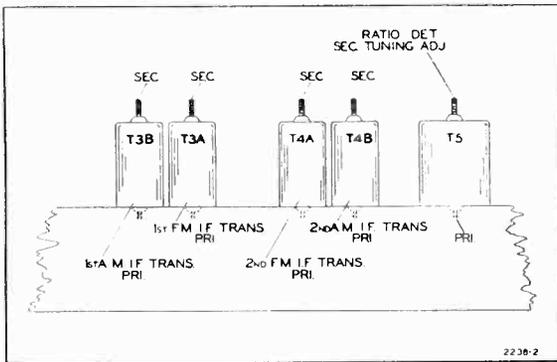

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4B AM windings See I.F. view	Maximum output Should be 1/2 watt.
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3B AM windings See I.F. view	Maximum output Should be 1/2 watt.
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be 1/2 watt.

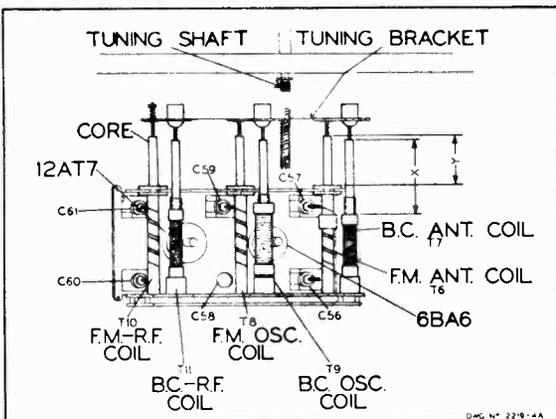

BROADCAST BAND-R.F. ALIGNMENT

*Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.
For adjustment, see dial mechanism illustration.*

SIGNAL GENERATOR FREQ.	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C59, C57, C61. For maximum, 1/2 watt

Loosen screw "A" so that teeth of tape can be properly meshed with pinion gear to give proper pointer travel.

With tuner all the way out, dimension "X" should be 1 1/2 inches. "Y" should be 1-1/32 inches. "X" is from the end of the slug to edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM Band. No slug adjustment should be necessary since the slugs are properly set at the factory.

ALIGNMENT PROCEDURE

FM Band Section I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT— No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.
All components used in this radio

are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE— The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other

words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENT TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	See note "A"	Secondary of T5	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T4A 10.7 m.c. windings See I.F. view	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3A See I.F. view	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-

point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

*Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.
For adjustment, see dial mechanism illustration.*

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R. F. C56 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter

as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

INDICATES CHASSIS

ALIGNMENT PROCEDURE

- Output meter connections.....Across primary output transformer
- Connection of generator ground.....Chassis
- Generator modulation.....App. 30% @ 400 cycles
- Position of volume control.....Fully Clockwise

POSITION OF DIAL POINTER	GENERATOR FREQUENCY	GENERATOR CONNECTION	TRIMMERS ADJUSTED	TRIMMER FUNCTION
540 kc	455 kc	125A7GT	T3, T4, T5, T6	I. F.
1500 kc	1500 kc	* * *	T2, T1	Osc., R. F.

See Note Below

IMPORTANT ALIGNMENT NOTES

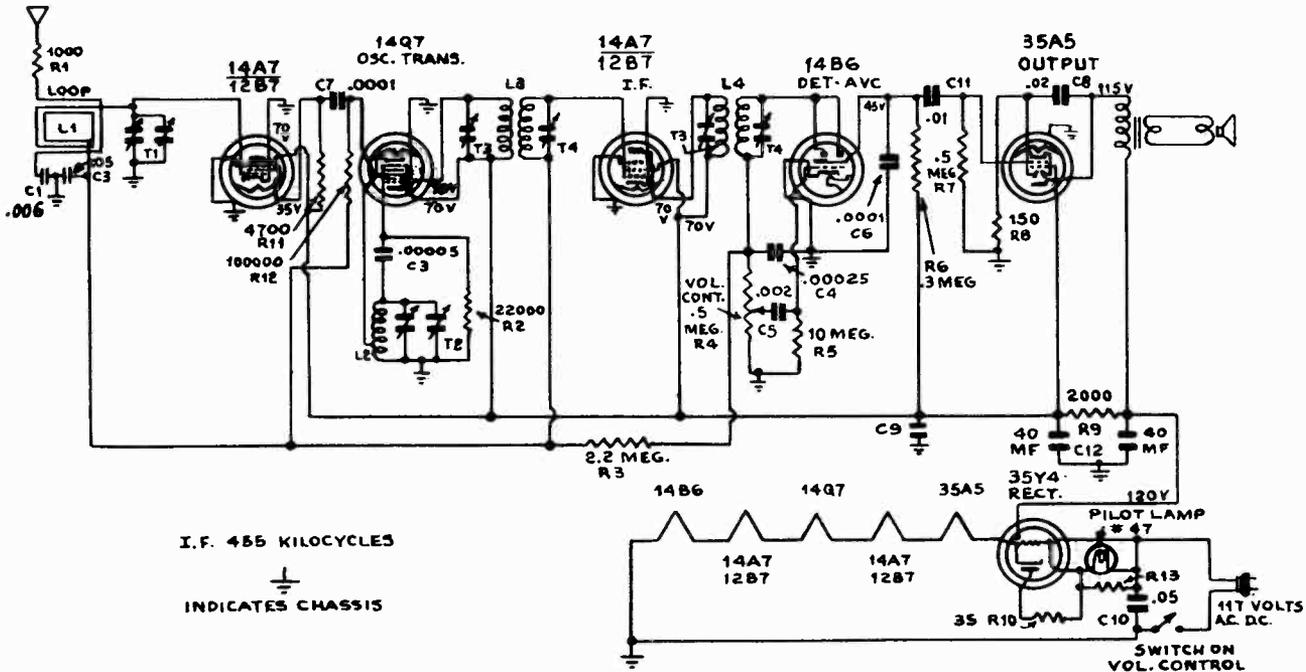

It is advisable to repeat the entire alignment procedure in the original order to insure greater accuracy.

Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

***Run a wire from the output terminal of the generator near the receiver. However, no connection is made between the signal generator and the receiver.

MODEL D2718B

WESTERN AUTO SUPPLY CO.

BROADCAST AND SHORT WAVE RADIO WITH BUILT-IN LOOP AERIAL

7 TUBE AC-DC (Including Rectifier) 2 BANDS

SHORT WAVE BAND

6 to 18 Megacycles

This band is calibrated in megacycles. The 16, 19, 25, 31 and 49 meter bands, in which the principal international short wave broadcasts will be heard, are located in this band.

These bands will be found on the dial as follows:

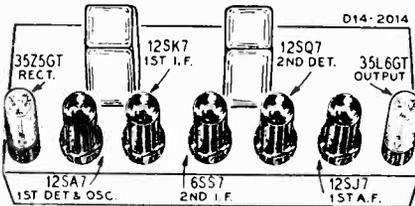

- 16 Meter Band... 17.7—17.9 MC
- 19 Meter Band... 15.1—15.3 MC
- 25 Meter Band... 11.7—11.9 MC
- 31 Meter Band... 9.5— 9.7 MC
- 49 Meter Band... 6— 6.2 MC

BROADCAST BAND

540 to 1600 Kilocycles

This band is calibrated in channel numbers. Add a zero to the dial number to get the kilocycle number.

CHECK YOUR LINE VOLTAGE

Unless otherwise marked, this radio must be operated on a power supply of 105-125 volts AC, 50 to 60 cycles only, or 105-125 volts DC.

WESTERN AUTO SUPPLY CO.

MODEL D2718B

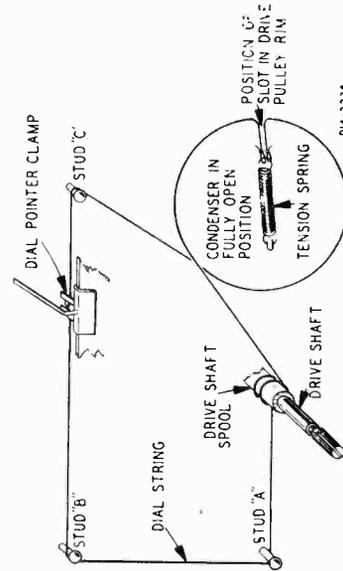

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments. Signal Generator which will provide an accurately calibrated signal at test frequencies as listed.
 Allow Chassis and Signal Generator to "Heat Up" for several minutes. Output indicating Meter; Non-Metallic Screw-driver.
 The equipment in column at right is required for aligning:
 Dummy Antennas—.1 mf., 50 mmf., and 400 ohm.

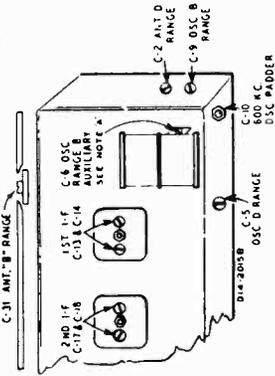

FREQUENCY SETTING	SIGNAL GENERATOR ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA CONNECTION	RAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
1. F. 435 KC	Signal Grid Ant. Connect at Stator of Large Gang Section.	Point "X"	.1 mf.	B Range	Turn Rotor to Fully Open Position	1st I.F. (C13) & (C14) 2nd I.F. (C17) & (C18)
RANGE B 1600 KC	External Antenna Clip	Point "X"	50 mmf.	B Range	Turn Rotor to Fully Open Position	Oscillator Range B (C9) See Note A
1400 KC	External Antenna Clip	Point "X"	50 mmf.	B Range	Turn Rotor to Max. Output	Antenna Range B (C-31)
Note D	External Antenna Clip	Point "X"	50 mmf.	B Range	Turn Rotor to Max. Output and Rock	600 KC Padder (C10) Rock Rotor See Note B
600 KC	External Antenna Clip	Point "X"	50 mmf.	B Range	Repeat above oscillator adjustments at 1600 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement of output.	
RANGE D 18.3 MC	External Antenna Clip	Point "X"	400 Ohm	D Range	Turn Rotor to Fully Open Position	Oscillator Range D (C5)
17 MC	External Antenna Clip	Point "X"	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C2)
Loop Range	Reassemble chassis in cabinet					
1400 KC	External Antenna Clip	Chassis	50 mmf.	B Range	Turn Rotor to Max. Output	Ant. Range B (C-31)
Note D						

DRIVE CORD REPLACEMENT

Use a new 10X51 drive cord assembly or a piece of new cord 45" long for this installation. Turn the large drive pulley counterclockwise until the gang condenser is in the fully open position, then fasten one end of the new drive cord to one end of the tension spring. Hook the other end of the tension spring over the tab on the drive pulley, pass the drive cord through the slot in the drive pulley rim and wind it 1/2 turn counterclockwise around the top of the drive pulley. Wind 2 turns around the drive shaft spool with the turns progressing towards the chassis. Continue with the cord around idler studs A, B and C as shown in the illustration. Wind the cord 3/4 turn counterclockwise around the large drive pulley, pass it through the slot in the pulley rim and fasten the end to the tension spring. Rotate the tuning shaft several turns to take up any slack in the drive cord, then attach the dial pointer to the cord.

DI-2238

ALIGNMENT NOTES

NOTE A—Adjust Oscillator Range B (C9) trimmer on side of chassis. Oscillator Range B (C6) auxiliary trimmer on gang condenser is adjusted at factory and ordinarily need not be readjusted in the field.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—Attach pointer to drive cord and position at 1400 KC mark on dial scale.

NOTE D—Some receivers have a "gimmick" capacity formed by twisting two wires together on the loop antenna in place of the Antenna Range B Trimmer, C-31. When aligning receivers having the "gimmick" capacity, proceed as instructed in the Alignment Procedure Table but omit the steps at 1400 KC involving C-31.

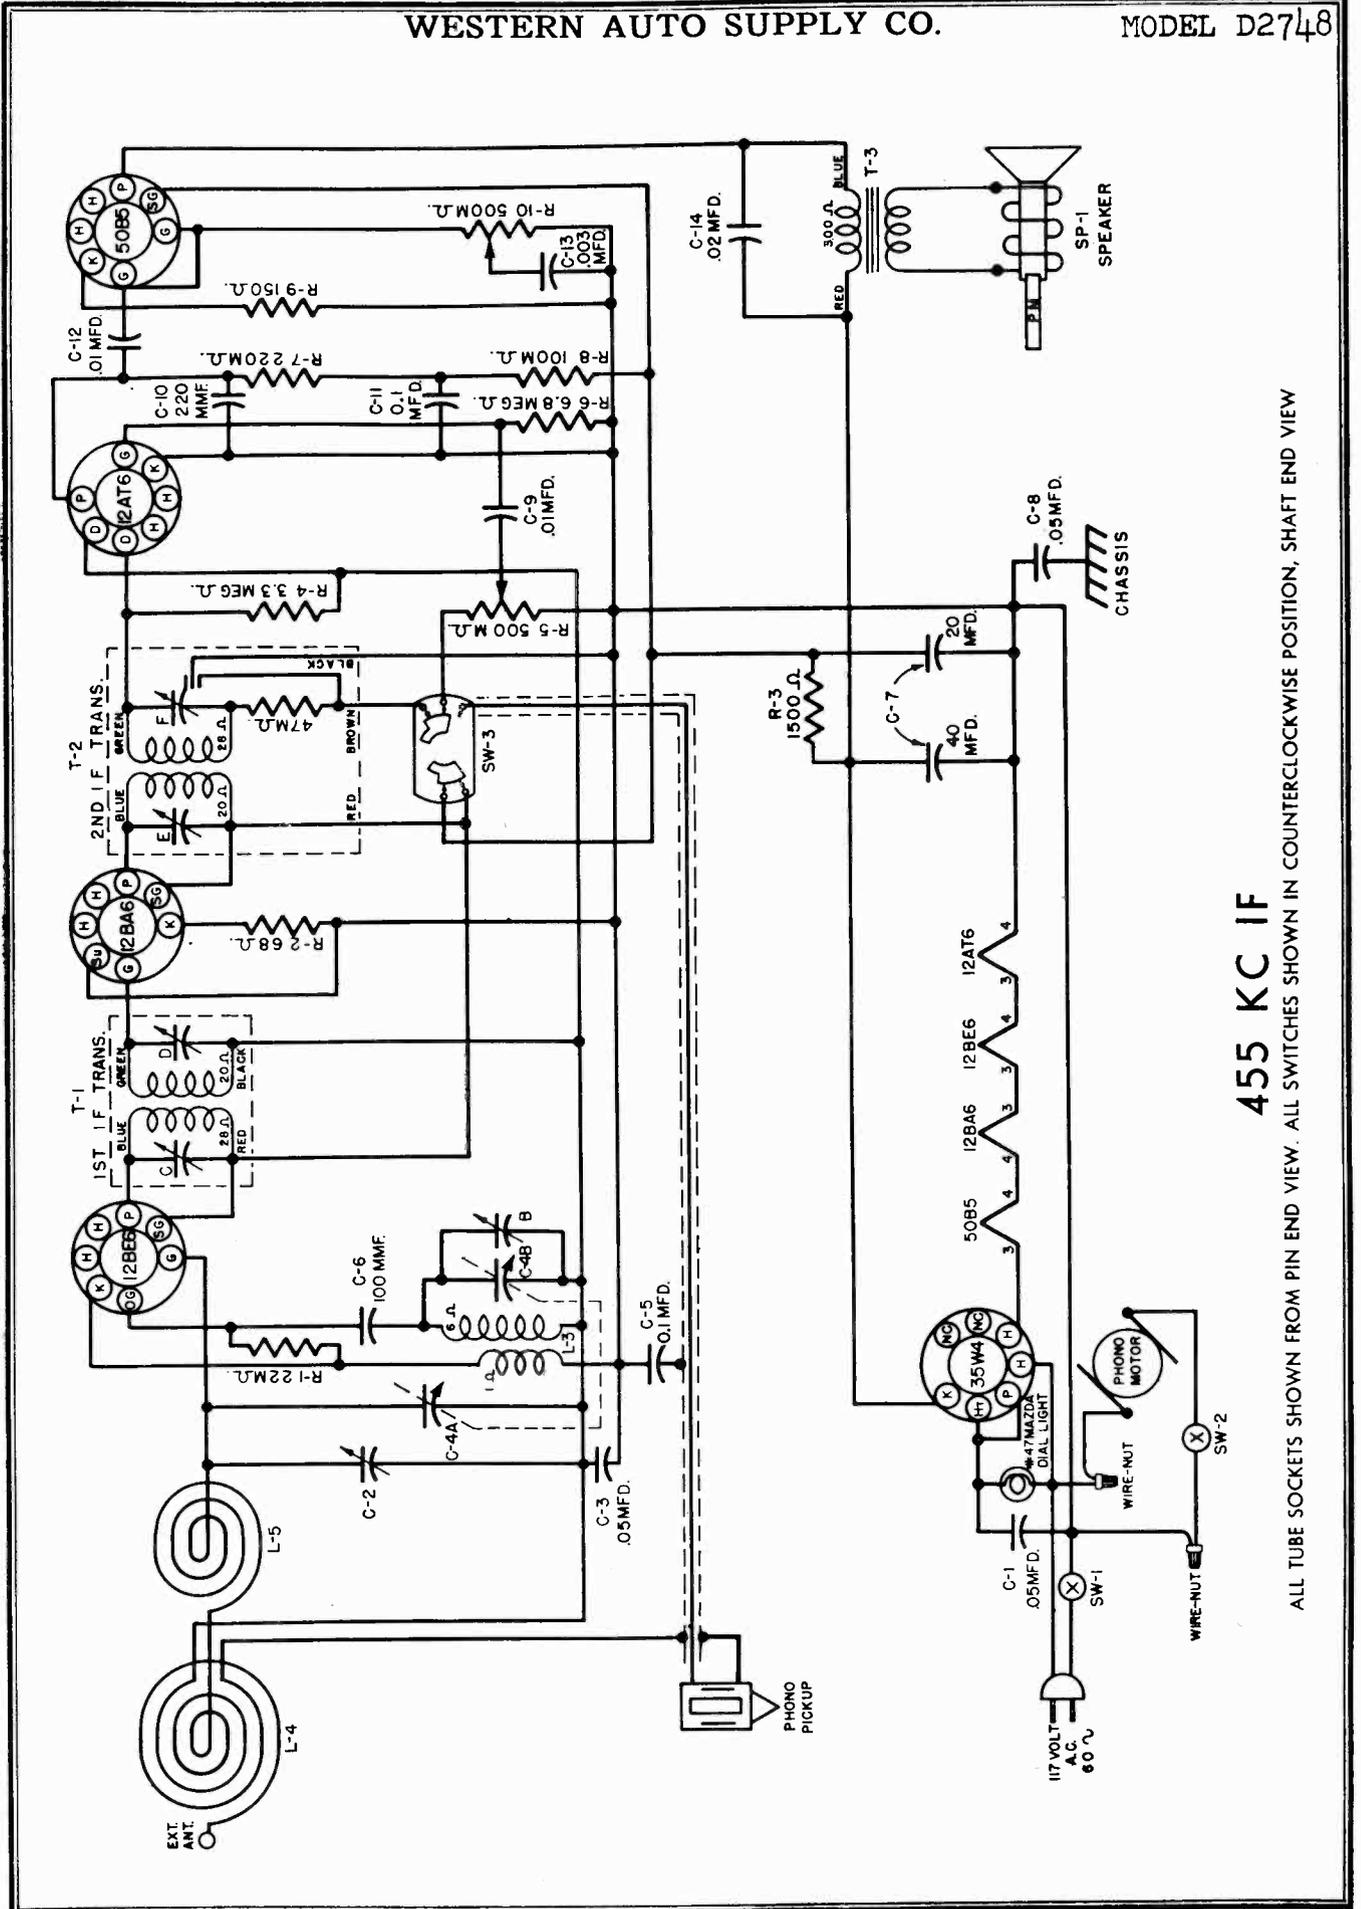

The "gimmick" capacity is set at the factory and normally will not require adjustments when realigning the receiver. Adjustment is obtained by twisting or untwisting the wires.

On receivers having the "gimmick" the dial pointer should be set at 1600 KC rather than as instructed in Note C.

On receivers having neither a trimmer or a "gimmick", the dial pointer should also be set at 1600 KC.

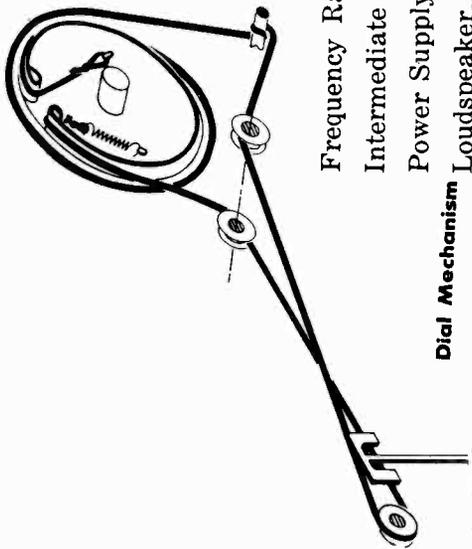

SPECIFICATIONS

- Power Consumption.....42 Watts (At 117 volts AC)
- Power Output.....9 Watt Maximum
- Selectivity.....49KC Broad at 1000 times Harmonics
- Intermediate Frequency.....455 KC
- Speaker.....4"x6" oval PM Dynamic
- Tuning Frequency Range
- B Range.....540 to 1600 KC
- D Range.....6000 to 18,000 KC
- Sensitivity (For .05 watt output—External Antenna).
- B range.....9 Microvolts Average
- D Range.....30 Microvolts Average

455 KC IF

ALL TUBE SOCKETS SHOWN FROM PIN END VIEW. ALL SWITCHES SHOWN IN COUNTERCLOCKWISE POSITION, SHAFT END VIEW

Frequency Range.....540-1600 kc.
 Intermediate Frequency.....455 kc.
 Power Supply.....117 volts AC, 60 cycle
 Loudspeaker.....5x7 elliptical type PM

Dial Mechanism

TUBE COMPLEMENT

- 1—12BE6 Converter tube
- 1—50B5 Power Output tube V.C. Impedance.....3.2 ohms at 400 cycles
- 1—12BA6 IF Amplifier tube
- 1—35W4 Rectifier tube
- Power Output (Undistorted)......8 watt
- 1—12AT6 Detector—AVC—First Audio tube
- Power Output (Maximum).....1.5 watts
- Tuning Drive Ratio.....7 to 1

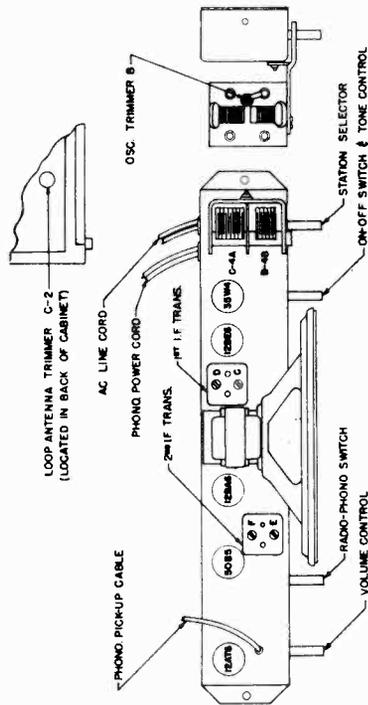

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd. — RMA loop.

NOTE: Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12BE6 grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

* Loop trimmer accessible through back of cabinet.

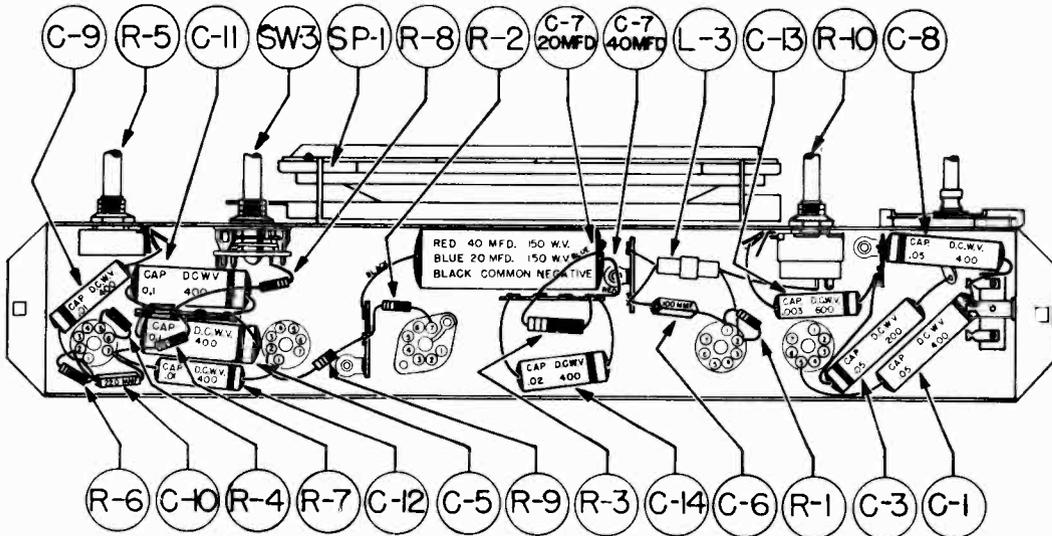

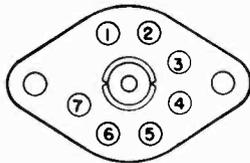

Tube Layout

GENERATOR	CONNECTION AT RADIO	DUMMY ANTENNA	DIAL	TO TUNE TRIMMERS	REMARKS
IF 455 kc.	12BE6 grid	.1 mfd.	HF end	IF trimmers C D E F	Tune to max.

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

DIPLOLE ANTENNA CONNECTIONS

RECORD PLAYER AND TELEVISION SOUND CONNECTIONS

For models not equipped with built-in record player, a socket marked PHONO is provided on the back of the chassis for connections to an external record player or automatic record changer. When it is desired to play records through the radio, insert the connector on the cable of any standard record player into this socket. Turn the phono-radio switch to the phone position and use the volume control to adjust the sound level.

When television programs become available in your community, the audio amplifier and speaker of this radio may be used in conjunction with a Television Picture Receiver and sound converter to reproduce the sound portion of the television programs. Simply insert the connector on the cable of the Television Converter into the socket marked PHONO and operate the receiver in the same manner as described in the foregoing paragraph.

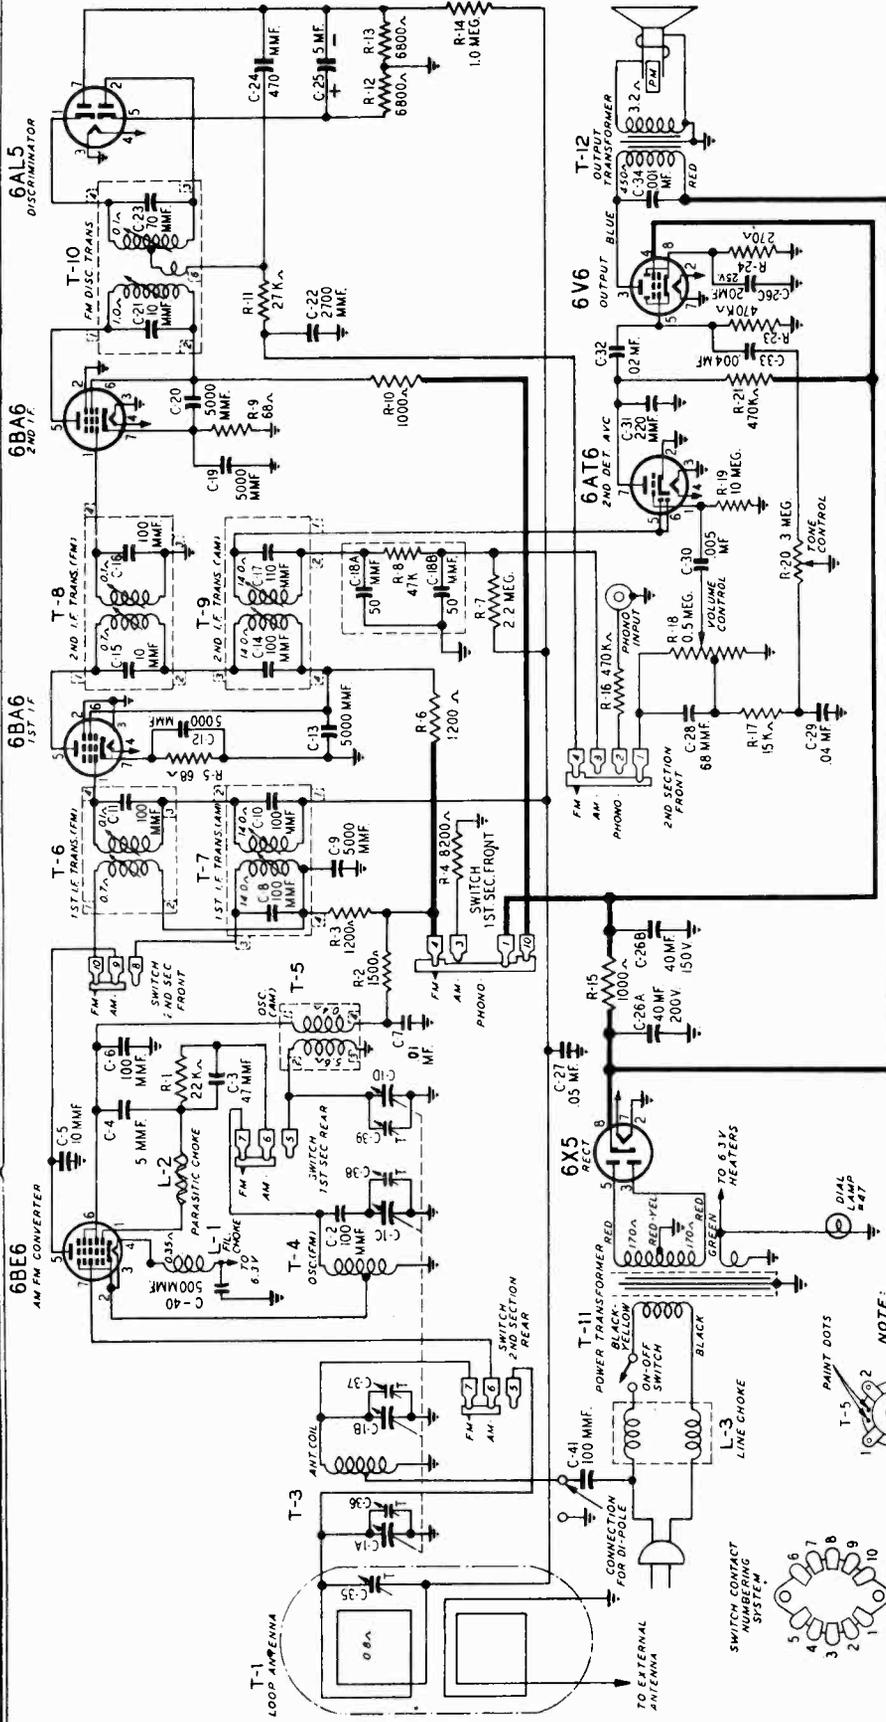

TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

- Line voltage117 Volts AC
- Signal InputNone
- A Variation of $\pm 10\%$ is usually permissible.

ALIGNMENT PROCEDURES
AM STAGES

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS (I-F ONLY) TRIMMERS (OSC. & ANT.)
455 KC	Control Grid 1st 6BA6 Pin No. 1	Chassis Base	.1 mf	Turn Rotor to Full Open	2nd I.F. Pri. & Sec.
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	Same as above	.1 mf	Turn Rotor to Full Open	1st I.F. Pri. & Sec.
1620 KC	Control Grid 6BE6 Pin No. 7	Same as above	.1 mf	Turn Rotor to Full Open	Oscillator C-39
1400 KC	External Antenna Lead	Same as above	50 mmf	Turn Dial to 1400 KC. See Note A	Antenna C-35

NOTE A—Attach pointer to drive cord and position of 1400 KC mark on dial scale.

FM STAGES

Allow chassis and signal generator to warm up for several minutes. The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 100 K ohms.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

	SIGNAL GENERATOR			BAND SWITCH SETTING	CONDENSER SETTING	ADJUSTMENT FOR MAX. METER DEFLECTION

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the A.V.C. line at the 27 K. ohm resistor (R-11) and its junction with terminal strip. A signal of .1 volt must be fed into the receiver for this adjustment.

Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from A.V.C. and connect it to the audio takeoff point at

the 1 megohm resistor (R-14) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator coil adjustments.

ALIGNMENT PROCEDURES

AM STAGES

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS AND TRIMMERS
455 KC	Control Grid 1st 6BA6 Pin No. 1	Chassis Base	.1 mf	Turn Rotor to Full Open	2nd I.F. C-14 & C-17
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	Same as above	.1 mf	Turn Rotor to Full Open	1st I.F. Pri. & Sec.
1620 KC	Control Grid 6BE6 Pin No. 7	Same as above	.1 mf	Turn Rotor to Full Open	Oscillator C-39
1400 KC	External Antenna Clip	Same as above	50 mmf	Turn Dial to 1400 KC. See Note A	Antenna C-35

NOTE A—Attach pointer to drive cord and position at 1400 KC mark on dial scale.

FM STAGES

Allow chassis and signal generator to warm up for several minutes. The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 100 K ohms.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

SIGNAL GENERATOR						
DISCRIMINATOR	FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUSTMENT FOR MAX. METER DEFLECTION

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the A.V.C. line at the 27 K. ohm resistor (R-11) and its junction with terminal strip. A signal of .1 volt must be fed into the receiver for this adjustment.

Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from A.V.C. and connect it to the audio takeoff point at the 4.7 megohm resistor (R-14) and its junction with the

terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator adjustments.

NOTE E—2nd I-F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

REPLACEMENT PARTS LIST

NOTICE: There is a Model Number label on the chassis. This label identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

MODEL D2910

SPECIFICATIONS

5 Tube Superheterodyne, including Rectifier Tube
 Tuning Frequency Range _____ 540 to 1600 KC
 Power Consumption _____ 30 watts (At 117 volts AC)
 Power Output...1.5 watt maximum, 9 watt (10% distortion)
 Intermediate Frequency _____ 455 KC
 Speaker _____ 5" PM Dynamic

CHECK YOUR LINE VOLTAGE

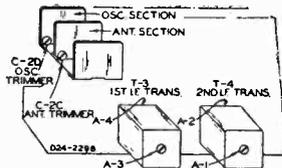

Unless otherwise marked, this radio must be operated on a power supply of 105-125 volts AC, 50 to 60 cycles only, or 105-125 volts DC.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
 Allow Chassis and Signal Generator to "Heat Up" for several Minutes.
 The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
 Output Indicating Meter: Non-Metallic Screwdriver.
 Dummy Antennas—.1 mf., 50 mmf.
 Blocking Condenser—.1 mf.

FREQUENCY SETTING	SIGNAL GENERATOR ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
455 K C	Control Grid 12SK7—I. F. Prong No. 4	Chassis Base Through .1 mf. Condenser	.1 mf.	Turn Rotor to full open	2nd I. F. A2 & A1
455 K C	Control Grid 12SA7—1st Det. Prong No. 8	Same As Above	.1 mf.	Turn Rotor to full open	1st I. F. A4 & A3
1620 KC	Control Grid 12SA7—1st Det. Prong No. 8	Same As Above	.1 mf.	Turn Rotor to full open	Oscillator (C-2D)
1400 KC	Reassemble chassis in cabinet See Note B	Same As Above	50 mmf. Set pointer to 1400 KC. See Note A		Antenna (C-2C)

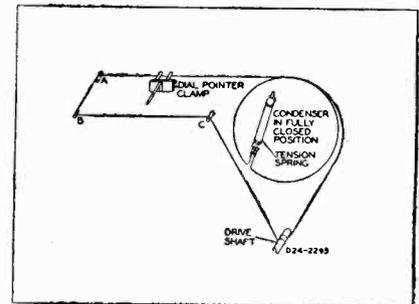

NOTE—Attach pointer to drive cord and position at 1400 KC mark on dial scale.

NOTE B—Wind 2 turn loop of heavy enameled wire 6" diameter connect to signal generator. Place loop of wire 6" from loop on set and in the same plane.

DRIVE CORD REPLACEMENT

Turn the large drive pulley to the fully closed position. Use a new 10x66 drive cord assembly or a piece of cord 43 inches long and fasten one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2 3/4 turns counterclockwise around the tuning shaft with the turns progressing toward the front of the chassis. After string is installed, stretch the tension spring and fasten free end of cord to spring.

TUBE COMPLEMENT

The tube complement of this receiver consists of the following:

- 1—6SK7—R.F. Amplifier
- 1—6SA7—Mixer—OSC.
- 1—6SK7—I.F. Amplifier
- 1—6SQ7—Det. AVC—Audio
- 1—6K6—Power Output
- 1—5Y3—Rectifier

POWER SUPPLY

This receiver is designed to operate from a power source of 117 volts A.C. 60 cycle current

Frequency - Range 535-1725 KC

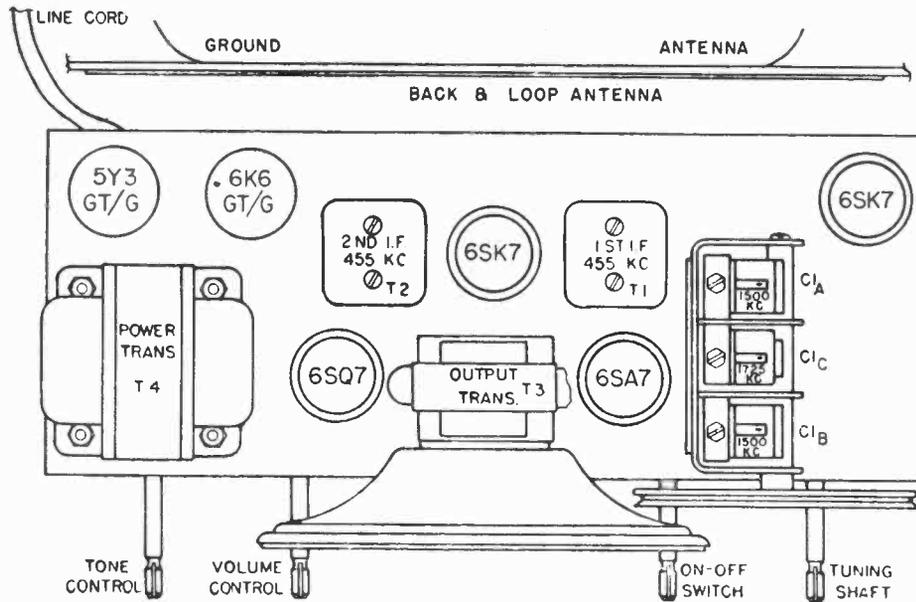

Fig 1 Chassis, Top View

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets and with a volt meter having a resistance of 1000 ohms per volt, using the 150 volt scale. These voltages are clearly indicated on the voltage chart. (Fig. 2).

All voltages should be measured with an A.C. line voltage of 117 volts.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTIONS

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE" on the next page. After realignment has been completed repeat the procedure as a final check.

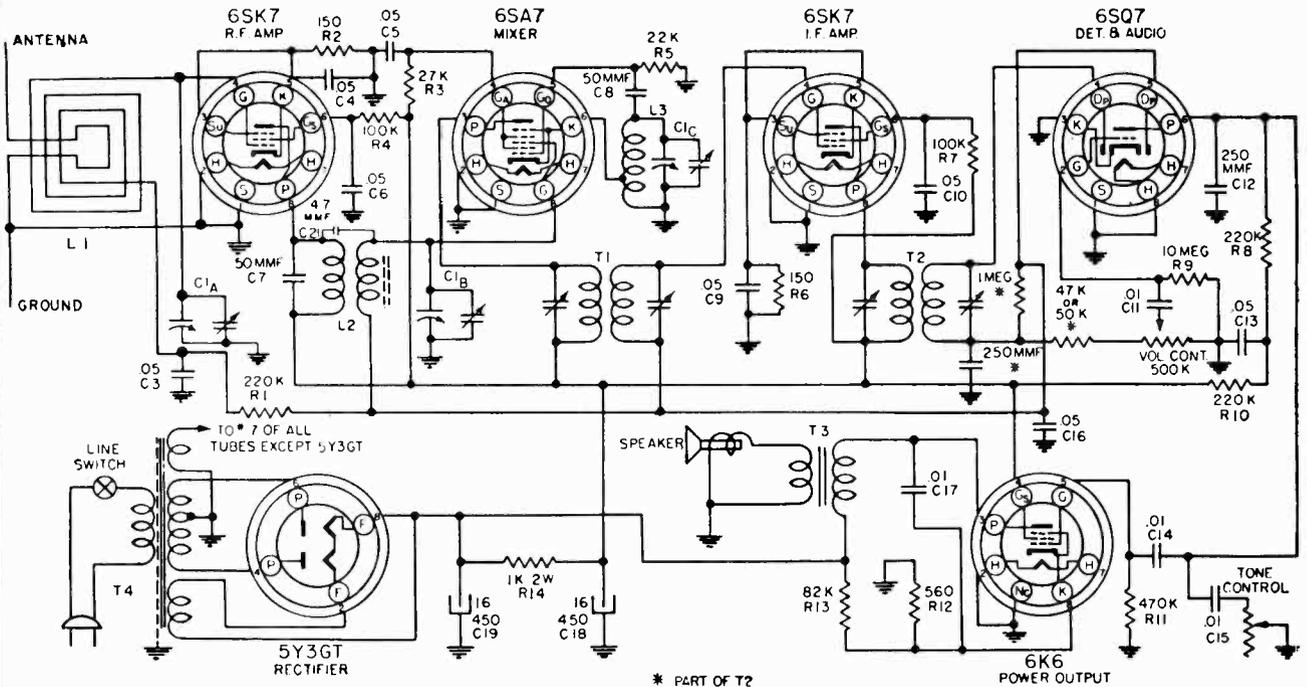

Fig. 3 Schematic Diagram
ALIGNMENT PROCEDURE

- Volume control—Maximum: all adjustments.
- Tone Control—Treble: Full Clockwise Rotation.
- Connect dummy antenna in series with output lead of signal generator.
- Connect output meter across voice coil of speaker.

- The following equipment is necessary for proper alignment:
- Signal generator that will provide the test frequencies as listed.
 - Output meter.
 - Non-metallic screwdriver.
 - Dummy antennas—.1 mfd., .00025 mfd.

Position of Variable	Generator Frequency	Dummy Ant. mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Minimum Capacity (Fully Opened)	455 K.C.	.1	High side to 6SA7 grid Low side to chassis	T1 T2	I. F.
Minimum Capacity (Fully Opened)	1725 K.C.	.00025	High side to ant. lead Low side to ground lead	C1C	Osc.
Tune in signal From Generator	1500 K.C.	.00025	High side to ant. lead Low side to ground lead	C1B	R. F.
Tune in signal from Generator	1500 K.C.	.00025	High side to ant. lead Low side to ground lead	C1A	Ant.

Repeat the above alignment procedure as a final check.

With an output meter connected across the voice coil of the speaker, the output meter reading for 1/2 watt is 1.25 volts using a signal which is modulated 400 c.p.s.

SOCKET VOLTAGES

All voltages are measured with a 1000 ohm per volt meter on the 150 volt scale, with no signal. To obtain an accurate voltage check the A.C. line voltage must be 117 volts. Where no voltage is shown the voltage is 0 or cannot be read with this type of voltmeter.

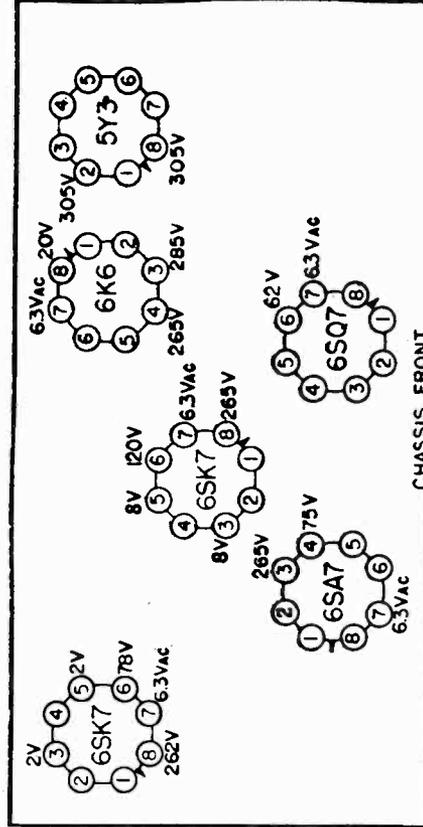

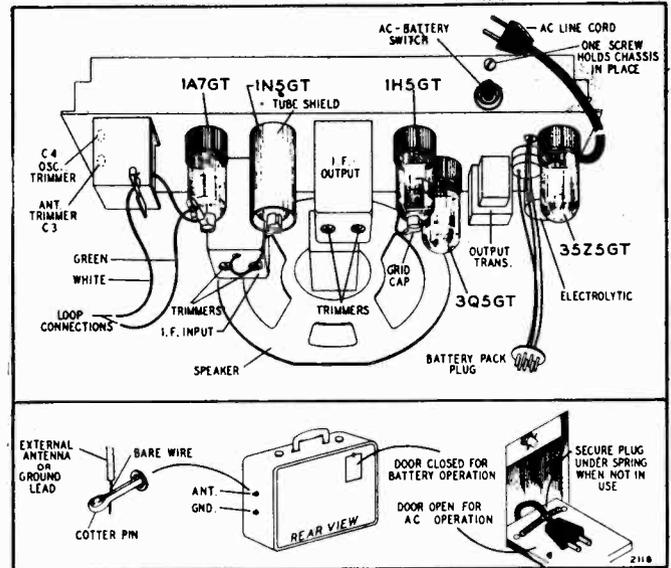

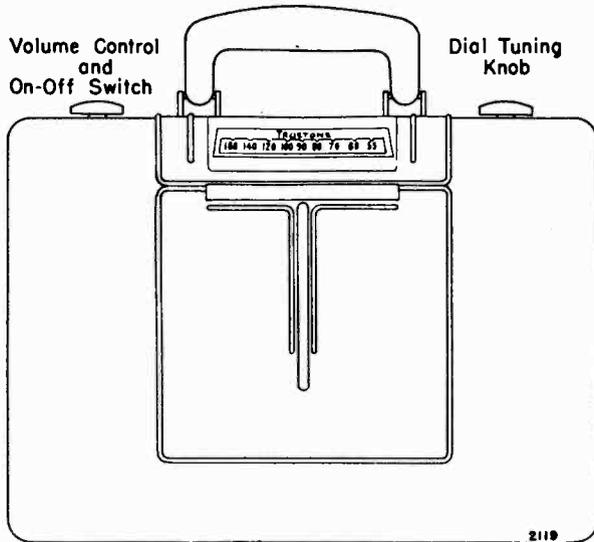

Fig. 2—Chassis, Bottom View

Chassis View

LINE VOLTAGE

If the set is to be operated from a house receptacle, the voltage, unless otherwise indicated, must be 105-125-volt DC (direct current) or 105-125-volt, 50-60 cycle AC (alternating current). If you are in doubt as to the voltage of the power supply, consult your local power company.

BATTERY PACK

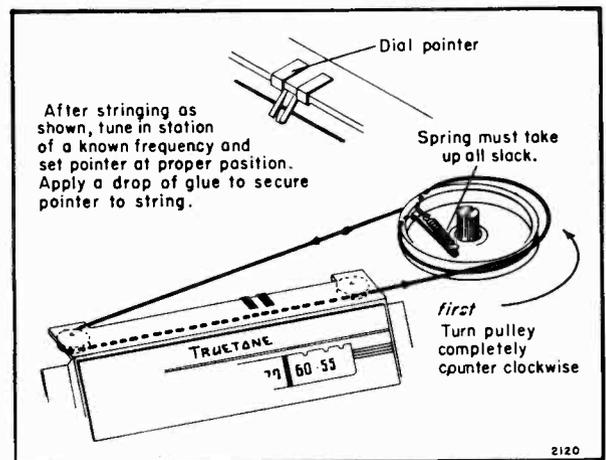

The battery pack used with this radio must contain a 7½-volt "A" battery and a 90-volt "B" battery. Use Wizard Battery Pack No. B6460 or No. B6470.

PILOT LIGHT

If the pilot lamp burns out, the set should not be operated on AC or DC power until a new lamp has been installed. Failure to heed this caution may result in a burned-out 35Z5GT tube.

ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts DC or 50-60 cycle AC, 29 watts.
	Battery: A—7½ volts, 50 ma.
	B—90 volts, 11 ma.
Frequency Range	530 to 1650 kc.
Intermediate Freq.	455 kc.
Tuning	Two-gang capacitor
Antenna	Built-in loop. Provisions also for external antenna and ground.
Speaker	5-inch; P.M.; voice coil impedance 3.2 ohms.
Power Output	150 milliwatts undistorted. 250 milliwatts maximum.
Sensitivity	30 microvolts average for 50-milliwatt output.
Selectivity	43 kc broad at 1000 times signal at 1000 kc.

POWER SUPPLY

WESTERN AUTO SUPPLY CO.

BATTERY

This receiver is designed to operate on either a Battery Pack; or any AC (Alternating Current) power supply line of 105 to 125 volts, 50 to 60 cycles; or DC (Direct Current) power supply line of 105 to 125 volts.

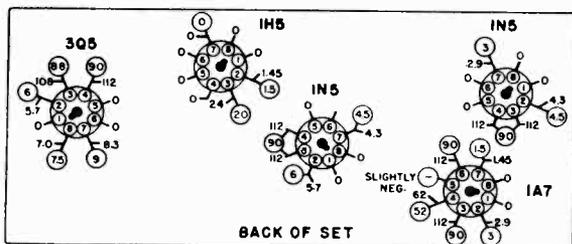

Any one of the following battery packs may be used in this portable radio: Western Auto Supply Wizard B6460 or B6470, Ensign AB50, Ensign AB49, General 60A-6F6-5, General 60B-6F6-5, Burgess F6A60, Burgess G6M60, Eveready 754, Ray-O-Vac AB878 or Ray-O-Vac AB994. For best results, use Western Auto Supply Wizard B6460 (Standard) or B6470 (Deluxe) battery packs for replacement.

DIAL SCALE NUMBERS

The dial scale numbers are calibrated in kilocycles provided one zero is added to the numbers indicated. For example, if the dial pointer is at 70, the radio is tuned to 700 kilocycles. The tuning range of this set is 535 to 1620 kilocycles.

VOLTAGE CHART

VOLTAGE DATA

1. Voltage readings circled (O) are for Battery Operation.
2. All readings made between Tube Socket Terminals and Pin No. 7 on the IH5.
3. A.C. Voltages measured on a 117 Volt A.C. line.
4. Battery Voltages measured with a fresh battery.
5. Dial turned to low frequency end, no signal.
6. All Voltages measured with a 1000 ohm-per-volt meter.

WESTERN AUTO SUPPLY CO.

MODELS D3630,
D3630N

1. Be sure both set and signal generator are thoroughly warmed up before starting alignment.
2. Make alignment, using a battery whenever possible.
3. Disconnect Loop Antenna leads from clips on set and remove chassis from cabinet.
4. Connect a 50,000 ohm carbon resistor across the two clips from which the Loop Antenna was removed.
5. Connect Output Meter across the Voice Coil.
6. Connect a fresh battery to the set.
7. Turn receiver Volume Control full on.

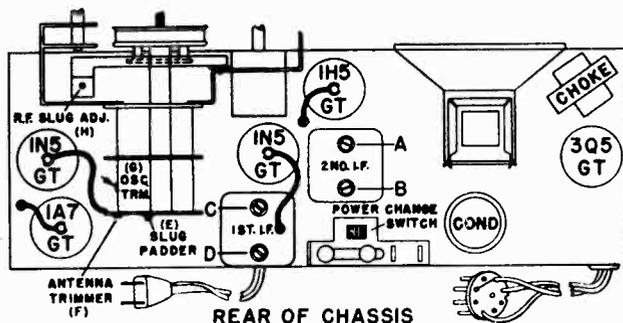

Step	Dummy Antenna Used in Series with Signal Generator	Connect High Side Signal Generator to	Signal Generator Frequency	Gang Condenser Setting	Trimmer Description and Designation	Type of Adjustment
1	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1A7	455 K.C.	Any point where it does not affect Signal	2nd I.F. (A), (B). 1st I.F. (C), (D).	Maximum Deflection. Then repeat
2	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1N5	1620 K.C.	Rotor full open (Plates out of mesh)	Oscillator Trimmer (G)	Maximum Deflection.
3	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1N5	1400 K.C.	Tune in Generator Signal	R.F. Slug (H)	Maximum Deflection.
4	Replace Set in Cabinet					
5	.00025 Mfd.	Antenna and Ground Leads*	1400 K.C.	Tune in Generator Signal	Antenna Trimmer (F)	Maximum Deflection.
6	Disregard the next two steps if the set being aligned is a model with a fixed loop loading coil (L2).					
7	.00025 Mfd.	Antenna and Ground Leads	600 K.C.	Tune in Generator Signal	Loop Loading Coil Slug (E)	Maximum Deflection.
8	.00025 Mfd.	Antenna and Ground Leads	1400 K.C.	Tune in Generator Signal	Reset Antenna Trimmer (F)	Maximum Deflection.

Seal adjusting screw on the loop loading coil with any quick drying cement.

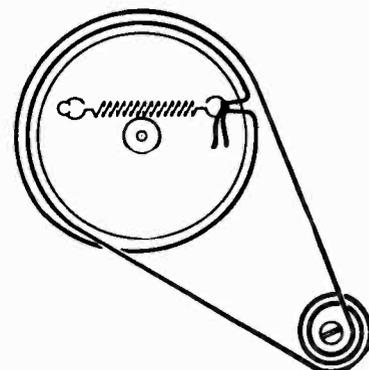

REPLACING R.F. TUNING SLUG

If the R.F. Tuning Slug has to be changed, use the following procedure. Set the gang condenser to the point where the plates are fully meshed. Screw the slug adjusting screw about halfway down. Place the slug in the coil in such a position that the top of the slug is flush with the top of the Coil. Solder the slug wire to the adjusting screw. Be sure that the position of the slug does not change during the soldering and that the slug wire is straight. Proceed to re-align the set as shown in the chart.

COILS AND TRANSFORMERS

- 162489 Coil—antenna coupling
- 502488 Transformer—1st I.F.
- 502489 Transformer—2nd I.F.
- 502902 Trans.—output for A-502491 speaker
- 502492 Trans.—output for R-502491 speaker
- 502528 Filter choke

OTHER ELECTRICAL PARTS

- 500746 Cable—for use with indivd. batteries.
- 500747 Cable—for use with battery pack.
- 500753 Neon indicator lamp
- 502526 Speaker—A.C.-DC "BAT.-CHARGE"
- 502901 Cone & voice coil for A-502491 speaker
- 502493 Cone & voice coil for R-502491 speaker
- 502491 Speaker—P.M. dynamic (8 inch)

MISCELLANEOUS PARTS

- 160026 Base for mtg. electrolytic condenser
- 112745 Clip—coil mtg.
- 117057 Card—dial drive (28" required) per lit.
- 502780 Escutcheon plate
- 502784 Knob volume or tuning
- 502785 Knob AC-DC "BAT.-CHARGE"
- 502527 Plug for battery cable (fits chassis)
- 502786 Retainer
- 81185 Ring for dial
- 117087 Ring for dial
- 75894 Screw—No. 8x3/4" for mtg. chassis
- 502524 Shaft—tuning control
- 117716 Shield—tube
- 116680 Socket—social battery
- 500681 Socket for battery cable
- 161384 Spring—dial cord tension
- 502533 Terminal strip for antenna
- 111456 Washer—spring washer for tuning shaft
- 502534 Washer—felt for knobs

WESTERN AUTO SUPPLY CO.

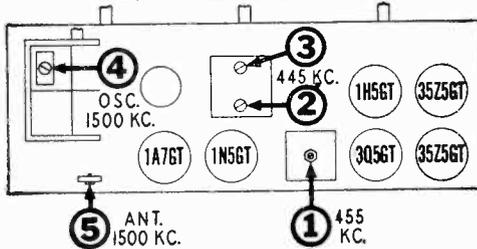

MODEL D3635

ALIGNMENT PROCEDURE

- Slide chassis partially out of cabinet by removing staples at each side of wood shelf and pulling entire shelf back about 2 inches. Do not disturb connections to loop antenna.
- Connect an output meter across the voice coil of the speaker or between the plate of the 3Q5GT output tube and chassis through a .1 mfd. condenser.
- Connect the ground lead of the signal generator to chassis through a .25 mfd. condenser.
- Set the volume control in the maximum position and use a weak signal from the generator.
- Set "AC-DC—BAT.—CHARGE" Switch in "AC-DC" position.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIG. GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
300 MMFD. Condenser	Grid Cap of 1A7GT Tube	455 KC.	Any Point Where It Does Not Affect Signal	1	2nd I.F.	Loosen lock nut. Adjust screw for maximum output.
				2-3	1st I.F.	Adjust for maximum output. Re-check 1, 2 and 3 for maximum output and tighten lock nut on 1.
300 MMFD. Condenser	Center Terminal on Antenna Terminal Strip at bottom of cabinet.	1500 KC.	1500 KC. (Slide set into cabinet and replace pointer to set dial.)	4	Broadcast Oscillator (Shunt)	Adjust trimmer for maximum output.
300 MMFD. Condenser	Center Terminal on Antenna Terminal Strip at bottom of cabinet.	1500 KC.	Tune to 1500 KC. Generator Signal	5	Broadcast Antenna	Adjust for maximum output. Slide chassis all the way into cabinet when making this adjustment.

TOP VIEW OF CHASSIS

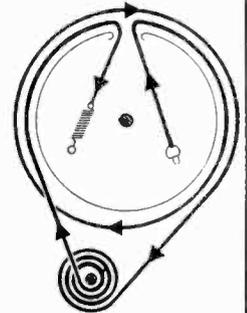

INDICATOR LAMP

The flashing neon lamp on the dial face indicates condition of batteries. This lamp is included in an oscillating (R-C) circuit which is designed to oscillate at approximately 3 pulses per second when batteries are in a fully charged condition. As the battery voltage decreases with use, number of pulses per second decreases.

This lamp will only show the true condition of the batteries when the Selector Switch is in the "Battery" position. Lamp flashes more rapidly during charging or "AC-DC" operation.

When battery voltage is low (approximately 72 volts) the lamp flashes more slowly (about once per second). The set should not be operated from battery power after this point is reached and batteries should be recharged immediately. Charge for at least twice the time they were used and as soon as possible after they are run down. As batteries age it is necessary to charge for a longer period. For longest battery life, charge immediately after using.

- IMPORTANT:**
- Completely dead batteries cannot be recharged.
 - When set is connected to a DC line, check for correct polarity by operating it before attempting to charge the batteries.
 - Batteries will be discharged if ON-OFF switch is left ON when power cord is not connected to wall outlet.

DIAL DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

- 114955 Clip on end of cord
- 117057 Cord (28 inches)
- 119087 Ring for dial cord
- 161384 Tension Spring

CHARGING CIRCUIT

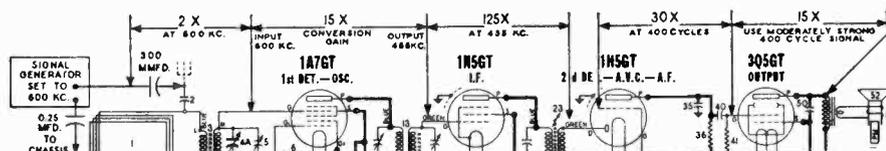

The battery charging circuit consists of a 35Z5GT rectifier and a suitable resistor voltage dividing network. This circuit provides a very low charging current when the receiver is operated on AC-DC and is just enough to maintain the batteries but will not charge them. A separate charging position is provided for the regular charging operation. A charging rate of approximately 1/3 the discharge rate is used to give best results.

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements.

- For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes).
- For R.F. and I.F. measurements connect negative terminal of a 1 1/2-volt battery to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.
- Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning).
- When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 1 1/2 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.

Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

CHARGING THE BATTERY

The specially developed electronic circuit used for charging the battery will produce best results if battery deterioration has not progressed too far. Check the battery frequently as described in the previous section. To use the built-in charger proceed as follows:

1. Plug the power cord into wall outlet.
2. Turn Selector Switch to "AC-DC" position and turn On-Off Switch to "ON" position.
3. Make sure that radio operates properly before attempting to use the charger. This is especially important when the radio power cord is connected to a D.C. (Direct Current) power supply. After you are sure the radio operates properly, turn the Selector Switch to the "CHARGE" position.
4. Allow the set to operate in this manner and charge the battery for at least twice as many hours as battery was previously used.
5. After charging is completed be sure to turn the radio On-Off Switch to the "OFF" position. If this switch is left on and the power cord is disconnected from the wall outlet, the battery will discharge.

If the receiver is equipped with individual "A" and "B" batteries instead of a single unit battery pack, the built-in charging circuits will recharge all four batteries.

THE DIAL SCALE is calibrated to cover frequencies between 540 Kc and 1600 Kc. Add a zero to dial number to obtain the frequency in kilocycles (Kc). Examples: When pointer is set to 90, radio is tuned to 900 Kc. See your newspaper for frequencies of local stations.

The bottom compartment of the cabinet provides adequate space to accommodate a single unit battery pack (or individual "A" and "B" batteries if desired). Any of the following single unit type battery packs may be used as a suitable power supply for this receiver.

WIZARD B6460
EVEREADY 754
GENERAL 60A-6F6-5
RAY-O-VAC AB-878 or AB-994
BURGESS G6BB60 or F6A60

Place the battery in the bottom compartment of the cabinet and wedge a piece of corrugated paperboard between the battery and the wall of the cabinet (see Fig. 1). The paperboard serves to hold the battery in a fixed position.

After the battery is installed in the cabinet it must be connected to the cable extending from the rear of the radio chassis. This cable is equipped with a special plug that will fit the receptacle in any of the single unit battery packs whose type numbers are listed above.

Where it is desired to use individual "A" and "B" batteries instead of the single unit battery pack, it will be necessary to obtain a special adapter cable (part 500746) in order to connect the separate batteries to the radio. Four batteries (two 4½ volt "A" batteries and two 45 volt "B" batteries) would be required for this type of installation. The following batteries will satisfactorily fit in the space provided:

INSTALLATION

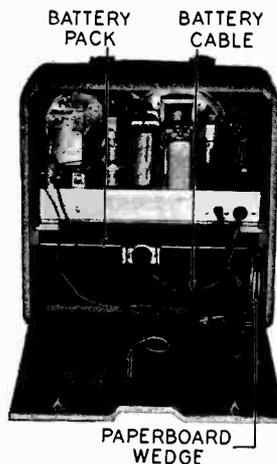

FIG. 1

4½ Volt "A" Battery
(2 required)

Wizard B6135
 Ray-O-Vac P83A
 Eveready 746
 Burgess G3

45 Volt "B" Battery

Wizard B6241
 Ray-O-Vac P7830
 Eveready 482
 Burgess M-30

CONNECTING RADIO TO ELECTRIC POWER SUPPLY: The rubber covered power cord and plug, which is coiled up and placed inside the cabinet when the radio is battery operated, must be connected to an electric power outlet if you wish to operate the radio from the power

line. The power cord must also be connected to the electric power outlet when using the special battery charger in this receiver.

IMPORTANT: Before connecting the power cord to the electric power outlet, close the back of the cabinet. Do not handle the metal chassis or attempt to remove tubes after the power cord is connected.

When connecting the radio to the electric power outlet be sure that outlet will supply the proper current and voltage. This radio may be connected to either 50 or 60 cycle Alternating Current (A.C.) at 105 to 125 volts or Direct Current (D.C.) at 105 to 125 volts. If in doubt as to the voltage and type of current which is supplied by an electric power outlet, call local power company.

If a Direct Current power supply is used and the radio does not operate after it has been turned on for approximately one minute, reverse plug connection at wall outlet.

REPLACEMENT PARTS LIST

FOR 105-125 VOLT A.C. OR D.C. OPERATION, REMOVE THIS PLUG FROM SOCKET AND PLUG INTO ELECTRIC OUTLET.

DIAL STRINGING DIAGRAM

ALIGNMENT PROCEDURE

- Output Meter across 3.2 ohm output load
- Volume control at maximum
- Connect ground post of signal generator to chassis
- Align for maximum output. Reduce input as needed to keep output near 0.05 watts

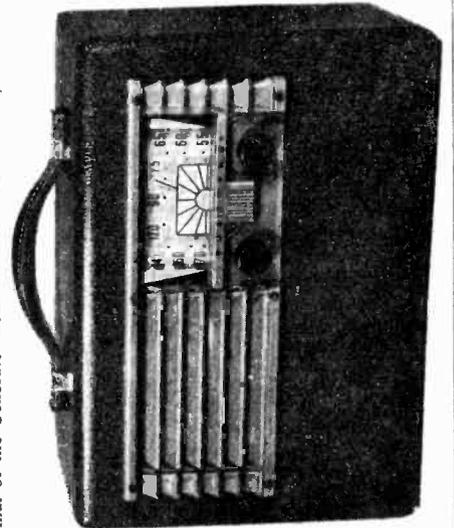

SIGNAL GENERATOR

Frequency	Connection to Radio	Dummy Antenna	Tuner Setting
455 KC	Center of antenna section of Gang	0.2 mf	Any
1500 KC	**	**	Set pointer at second dot from end. On dial pan
15000 KC	**	**	Set pointer at second dot from end. On dial pan

Adjust for Maximum Output (in order shown)

- Trimmers on I.F. Can
- Oscillator Trimmer on Gang
- R.F. Trimmer on Gang

** Run a wire from Output Terminal of the Generator near the Receiver. However, no connection is made between the signal generator and the Receiver.

**ALIGNMENT PROCEDURE
BROADCAST AND SHORT WAVE BANDS**

Connect an output meter across the speaker voice coil.

With the volume control set for maximum output and the signal from the generator attenuated to avoid A.V.C. action, proceed as follows:

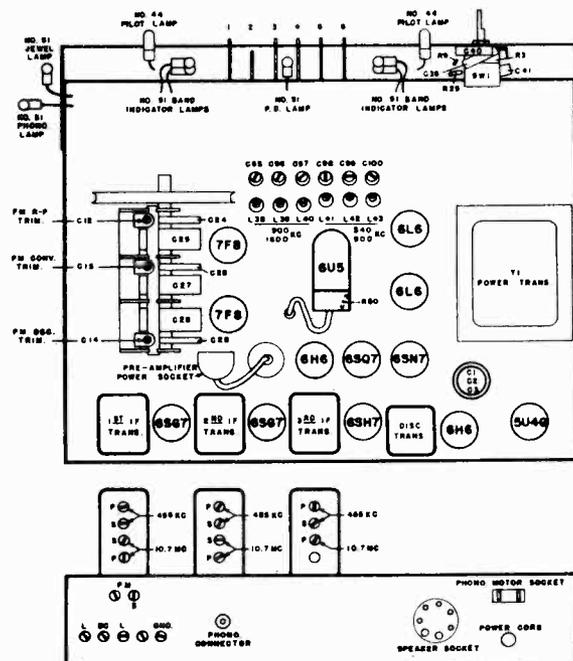

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1.	Set selector switch to "AM"			
2.	Pin #4 on 6SG7, 2nd I-F amplifier tube through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 3rd I-F for max. output.
3.	Pin #4 on 6SG7, 1st I-F amplifier tube through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 2nd I-F for max. output.
4.	Pin #1 on 7F8, converter tube through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 1st I-F for max. output.
5.	Converter section of gang (C27) through a 0.1 mfd capacitor	455 kc	550 kc	Carefully "peak" all 455 kc I-F transformers for max. output.
6.	B.C. antenna terminal through a 200 mmf capacitor	1500 kc	1500 kc	B.C. oscillator trimmer (C11) for max. output.
7.	Radiated signal (no actual connection)	1400 kc	1400 kc	B.C. converter (C9) and antenna (C8) trimmers for max. output.
8.	B.C. antenna terminal through a 200 mmf capacitor	600 kc	600 kc	B.C. oscillator padder (C10) for max. output. Rock gang while aligning padder.
9.	Recheck steps 6, 7, and 8.			
10.	Set selector switch to "SW-1"			
11.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	9 mc	9 mc	Short Wave #1 oscillator trimmer (C21) for max. output.*
12.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	9 mc	9 mc	Short Wave #1 converter (C18) and antenna (C15) trimmers for max. output. Rock gang while adjusting trimmers.
13.	Set selector switch to "SW-2"			
14.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	18 mc	18 mc	Short Wave #2 oscillator trimmer (C23) for max. output.*

FREQUENCY RANGES:

Standard Broadcast 540 to 1615 kc.
 Short Wave 1 5 to 10 mc.
 Short Wave 2 12 to 20 mc.
 Frequency Modulation 88 to 108 mc.

TUBE COMPLEMENT:

1 7F8 R-F Amp.
 1 7F8 Conv.-Osc.
 2 6SG7 1st and 2nd I-F Amp.
 1 6SH7 Limiter (FM)
 1 6H6 Ratio Det. (FM)
 1 6H6 or 6H6GT Det. and AVC (AM)
 1 6SQ7 A-F Amp.
 1 6SN7 or 6SN7GT Driver
 2 6L6 or 6L6GA Power Output Amp.
 1 6U5 Tuning Indicator
 1 5U4G Rectifier
 1 6SC7 Phono. Pre-Amp.

WESTINGHOUSE ELECTRIC CORP.

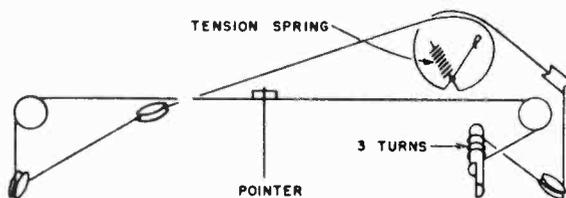

MODEL H-169

PUSH BUTTONS

Push buttons 1 to 3 are designed to receive stations from 900 to 1600 kc; push buttons 4 to 6 receive stations from 540 to 900 kc.

Refer to Fig. 3 for adjustor locations, and then proceed as follows:

1. Turn on radio and allow it to warm for five minutes.
2. Set the selector on AM, and tune in the desired station of the highest frequency (900 to 1600 kc).
3. Re-set the selector to PUSH BUTTONS and depress No. 1 push button (right button viewed from the front).
4. Adjust C95 for maximum receiver output (either a station or static will be heard depending on the setting of L38). Now adjust L38 until the desired station is heard. It may be necessary to re-adjust C95 at intervals to maintain receiver sensitivity.
5. Make a final adjustment of L38 for correct tuning and C95 for maximum output.
6. Return the selector to AM to make certain that the push button has been set on the desired station.
7. Adjust the remaining push buttons in the same manner.

BROADCAST AND SHORT WAVE BANDS

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
15.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	18 mc	18 mc	Short Wave #2 converter (C20) and antenna (C17) trimmers for max. output.
16.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	12 mc	12 mc	Short Wave #2 oscillator padder (C22) to receive 12 mc signal.
17.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	12 mc	12 mc	Short Wave #2 converter (C19) and antenna (C16) padders for max. output.
18.	Repeat steps 14, 15, 16 and 17 until calibration and tracking is correct.			

FM BAND

Do not align the 10.7 mc I-F circuits until all 455 kc I-F adjustments have been completed.

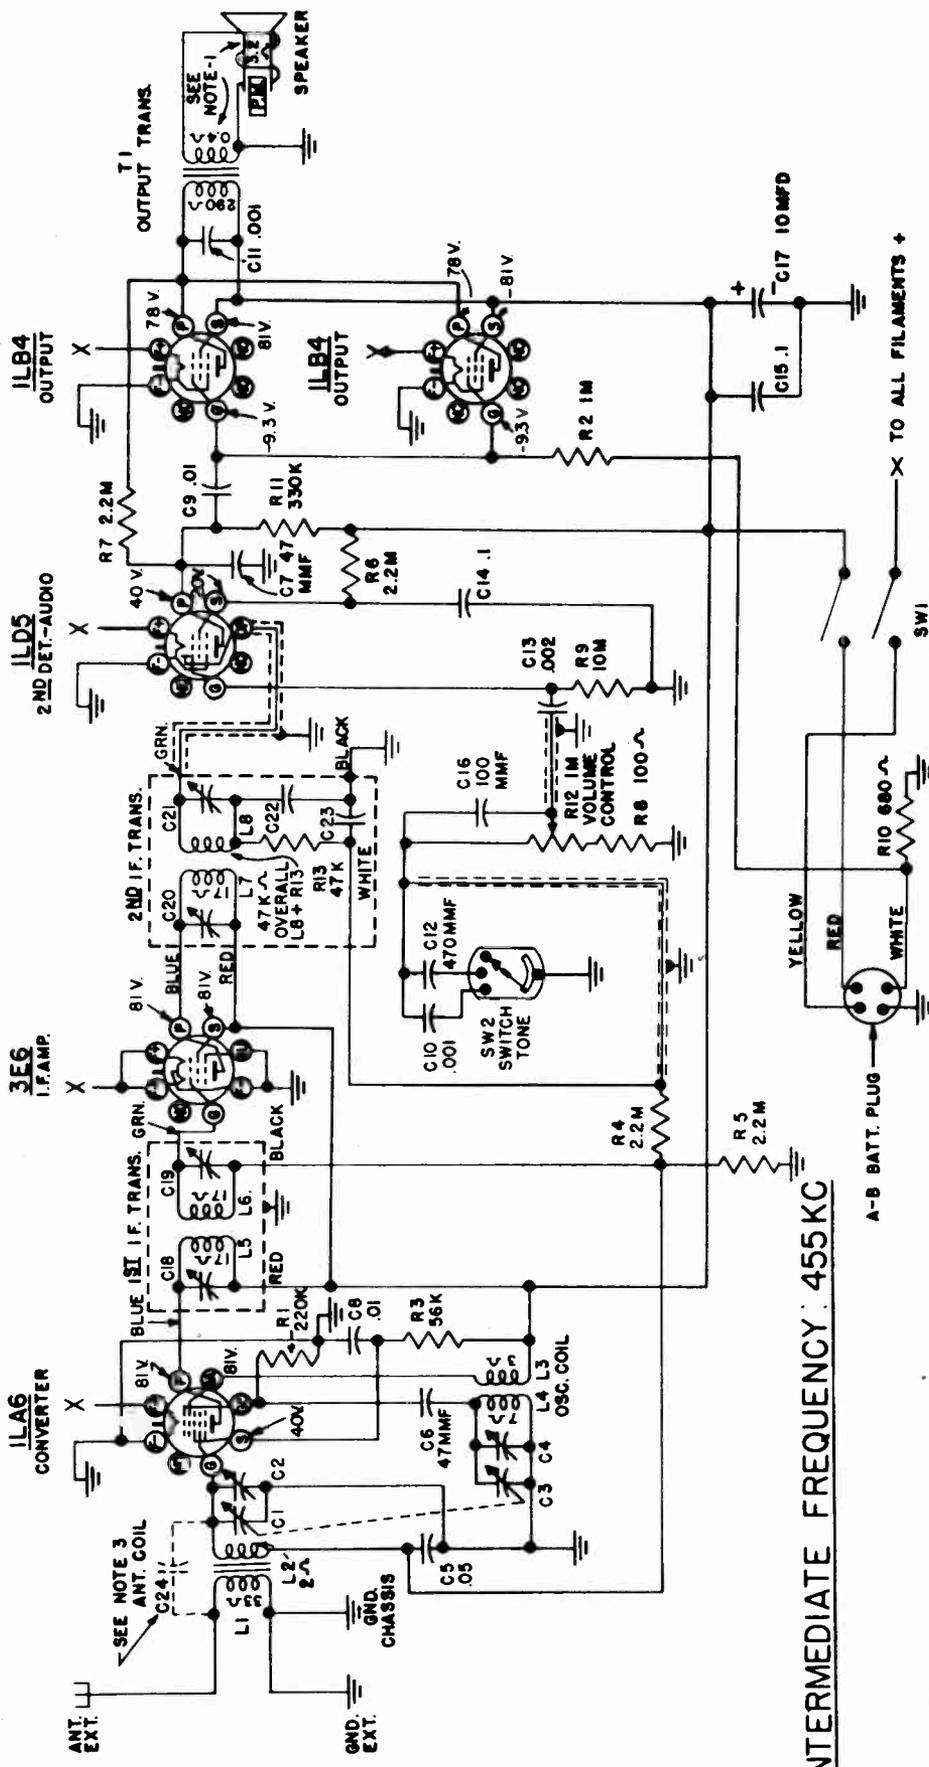

1.	Set selector switch to "FM"			
2.	Connect a vacuum tube voltmeter between point X (see Figs. 1 and 2) and ground (chassis).			
3.	Pin #4 on 6SH7 limiter tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	Secondary of discriminator transformer (C94) for zero voltage.
4.	Re-connect the vacuum tube voltmeter to pin #3 on the 6H6 ratio detector tube.			
5.	Pin #4 on 6SH7 limiter tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	Primary of discriminator transformer (L34) for max. voltage.
6.	Pin #4 on 6SG7 2nd I-F tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	10.7 mc. pri. of 3rd I-F trans. for max. voltage.
7.	Pin #4 on 6SG7 1st I-F tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	10.7 mc. pri. and sec. of 2nd I-F trans. for max. voltage.
8.	Pin #1 of 7F8 converter tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	10.7 mc. pri. and sec. of 1st I-F trans. for max. voltage.
9.	Pin #1 of 7F8 converter tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	Recheck all 10.7 mc. I-F adjustments and discriminator primary (L34) adjustment.
10.	Re-connect the vacuum tube voltmeter to point X.			
11.	Stator of FM tuning capacitor (C26) through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	Secondary of discriminator trans. (C94) for zero voltage.
12.	Re-connect the vacuum tube voltmeter to pin #3 on the 6H6 ratio detector.			
13.	FM antenna terminals through a 72 ohm resistor (low side of generator to "S" terminal)	UNMODULATED 105 mc	105 mc	FM oscillator trimmer (C14) for max. voltage.
14.	FM antenna terminals through a 72 ohm resistor (low side of generator to "S" terminal)	UNMODULATED 105 mc	105 mc	FM converter (C13) and R-F (C12) trimmers for max. voltage.
15.	Re-check steps 13 and 14.

V-5065-2	Strike, bullet catch (blonde)	V-3166S	Pulley, 7/16 dia.
V-5168-1	Strip, felt, 5/16" x 15" (mahogany)	V-5166-1	Push button
V-5168-2	Strip, felt, 5/16" x 15" (blonde)	V-5232	Race, bearing, for speaker turntable
V-5234	Stud, bearing, for speaker turntable	V-5203	Reflector, dial
V-3167S-1	Stud, pulley, threaded	V-5134	Resistor, 190 ohms 4 w. (R4)
V-5235	Stud, threaded, for speaker turntable	V-5340	Resistor, 290 ohms 2.3 w. (R5)
V-3261-3	Switch, push button (SW10A, SW10B)	RC10AE102M	Resistor, 1000 ohms 1/4 w. (R6)
V-5135	Switch, selector, (SW2, SW3, SW4, SW5, SW6, SW7, SW8, SW9)	RC20AE393K	Resistor, 39K 1/2 w. (R7)
V-5152	Tab, AM and SW1	RC10AE274M	Resistor, 270K 1/4 w. (R8, R9, R10)
V-5185	Tab, FM and SW2	RC20AE682K	Resistor, 6800 ohms 1/2 w. (R11)
V-5174	Tab, station	RC10AE105M	Resistor, 1.0 megohm 1/4 w. (R12, R13, R15, R16, R17)
V-3482	Teenut, for speaker box	RC10AE104K	Resistor, 100K 1/4 w. (R14, R18, R19)
V-5144	Terminal Board, ANT-GND	RC10AE273K	Resistor, 27K 1/4 w. (R20)
V-3417	Terminal Board, FM antenna	RC10AE473M	Resistor, 47K 1/4 w. (R21)
V-5136	Transformer, driver (L21, L22)	RC10AE222M	Resistor, 2200 ohms 1/4 w. (R22)
V-5373	Transformer, 1st I-F (C83, C84, C85, C101, C102, L23, L24, L25, L26)	RC10AE683M	Resistor, 68K 1/4 w. (R23)
V-5374	Transformer, 2nd I-F (C86, C87, C88, C89, R49, L27, L28, L29, L30)	RC10AE225M	Resistor, 2.2 megohms 1/4 w. (R24, R25)
V-5375	Transformer, 3rd I-F (C90, C91, C92, L31, L32, L33)	RC10AE273M	Resistor, 27K 1/4 w. (R26)
V-5212	Transformer, discriminator (C93, C94, L34, L35, L36, L37)	RC10AE153J	Resistor, 15K 1/4 w. (R27, R28)
V-5137	Transformer, power	RC20AE330K	Resistor, 33 ohms 1/2 w. (R29, R30)
V-3274S	Tube Holder	RC10AE223K	Resistor, 22K 1/4 w. (R31)
V-3317	Tuner, push button	RC10AE680M	Resistor, 68 ohms 1/4 w. (R32)
V-5222	Turntable Assembly, for speaker box	RC10AE274K	Resistor, 270K 1/4 w. (R33, R34)
V-3506S-1	Washer, chassis mounting, Neoprene	RC20AE333M	Resistor, 33K 1/2 w. (R35)
V-3752S	Washer, felt, for knobs	RC10AE154K	Resistor, 150K 1/4 w. (R36)
V-3267S-3	Washer, flat, chassis mounting	RC10AE474M	Resistor, 470K 1/4 w. (R37)
V-3267S-10	Washer, flat, record changer mounting	RC40AE223K	Resistor, 22K 2 w. (R38)
V-3215S	Washer, spring, for tuning shaft	RC30AE333K	Resistor, 33K 1 w. (R39, R40)
V-5175	Windows, station tab	RC20AE103K	Resistor, 10K 1/2 w. (R41)
		RC10AE222K	Resistor, 2200 ohms 1/4 w. (R42)
		RC20AE471K	Resistor, 470 ohms 1/2 w. (R43, R44)
		RC40AE682K	Resistor, 6800 ohms 2 w. (R45)
		RC30AE332K	Resistor, 3300 ohms 1 w. (R46, R47)
		RC10AE221K	Resistor, 220 ohms 1/2 w. (R48)

INTERMEDIATE FREQUENCY: 455 KC

- NOTE -
1. VOICE COIL DISCONNECTED.
 2. ALL VOLTAGES MEASURED FROM CHASSIS (GND) USING 20,000 OHMS/VOLT METER. READINGS SHOULD APPROXIMATE THE VALUES SHOWN WITHIN 20 PERCENT.
 3. NOT USED ON ALL CHASSIS.

FREQUENCY RANGE:

Standard Broadcast and Police 550 to 1700 kc

POWER OUTPUT:

Undistorted 140 milliwatts
 Maximum 350 milliwatts

LOUDSPEAKER:

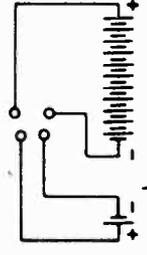

Size and Type 5 1/4" P. M.
 Voice Coil Impedance 3.2 ohms

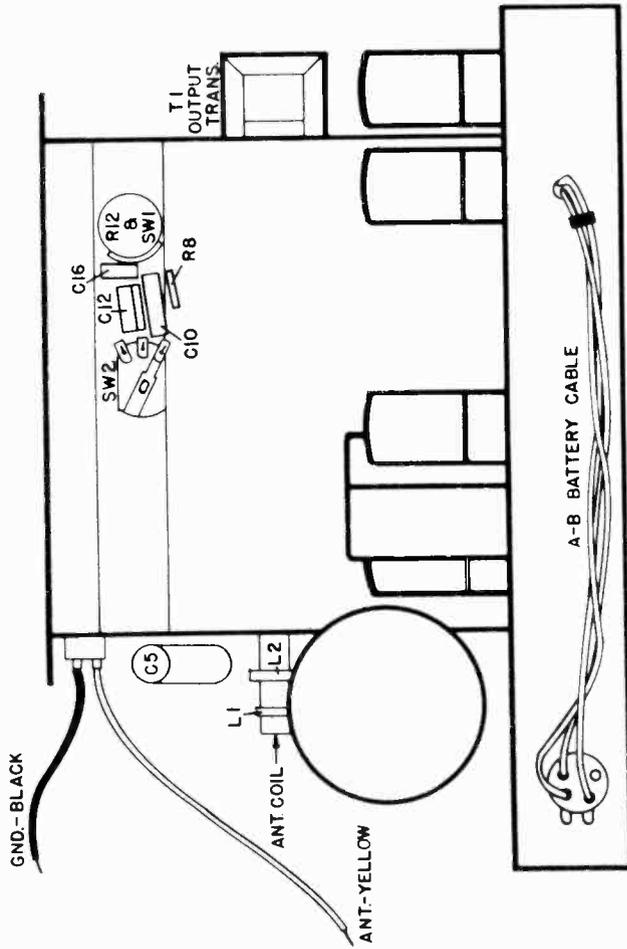

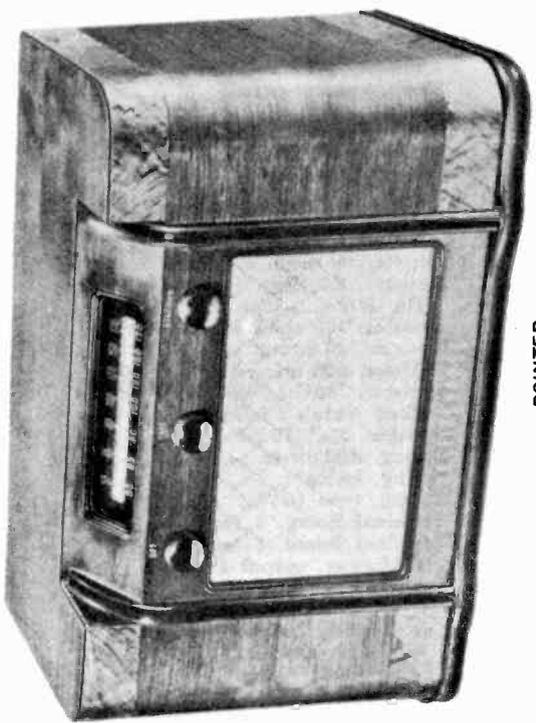

POWER SUPPLY:

1 Westinghouse V-3594 "AB" Battery Pack
 (1 1/2 v. "A" and 90 v. "B")

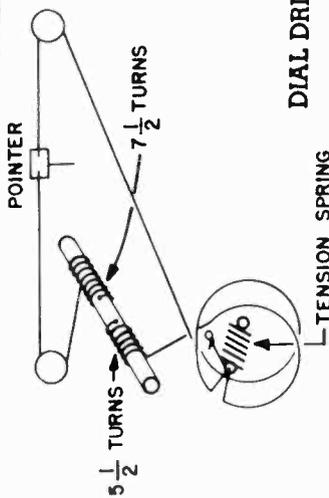

CURRENT CONSUMPTION:

"A" Section of "AB" Battery 260 ma.
 "B" Section of "AB" Battery 16 ma.

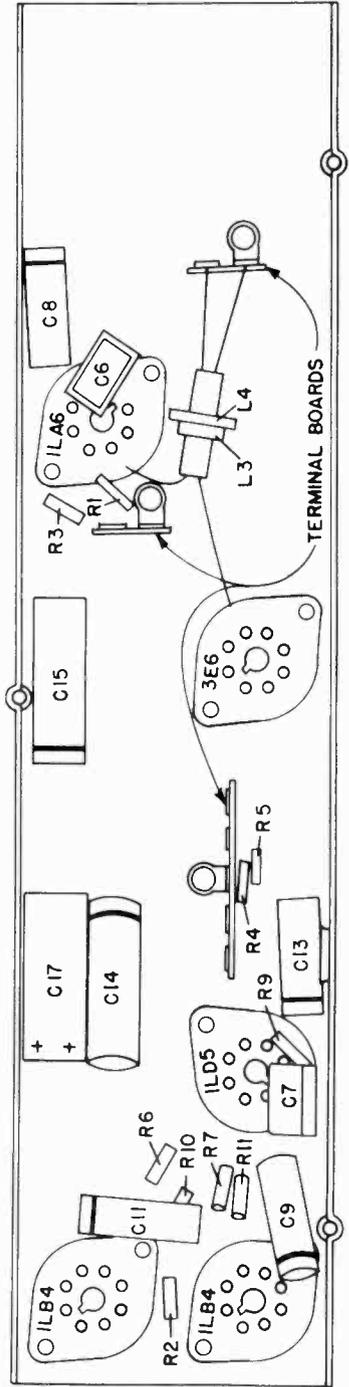

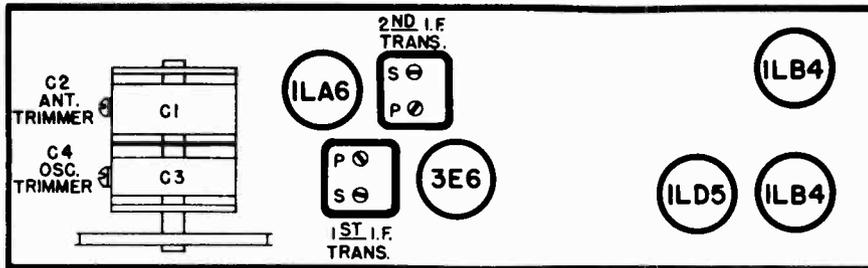

REAR VIEW OF CHASSIS

DIAL DRIVE MECHANISM

BOTTOM VIEW OF CHASSIS

CHASSIS LAYOUT

ALIGNMENT

Before beginning alignment, make certain that the dial pointer aligns with the dot on the extreme high-frequency end of the dial when the tuning capacitor is set for minimum capacity.

Connect an output meter across the speaker voice coil.

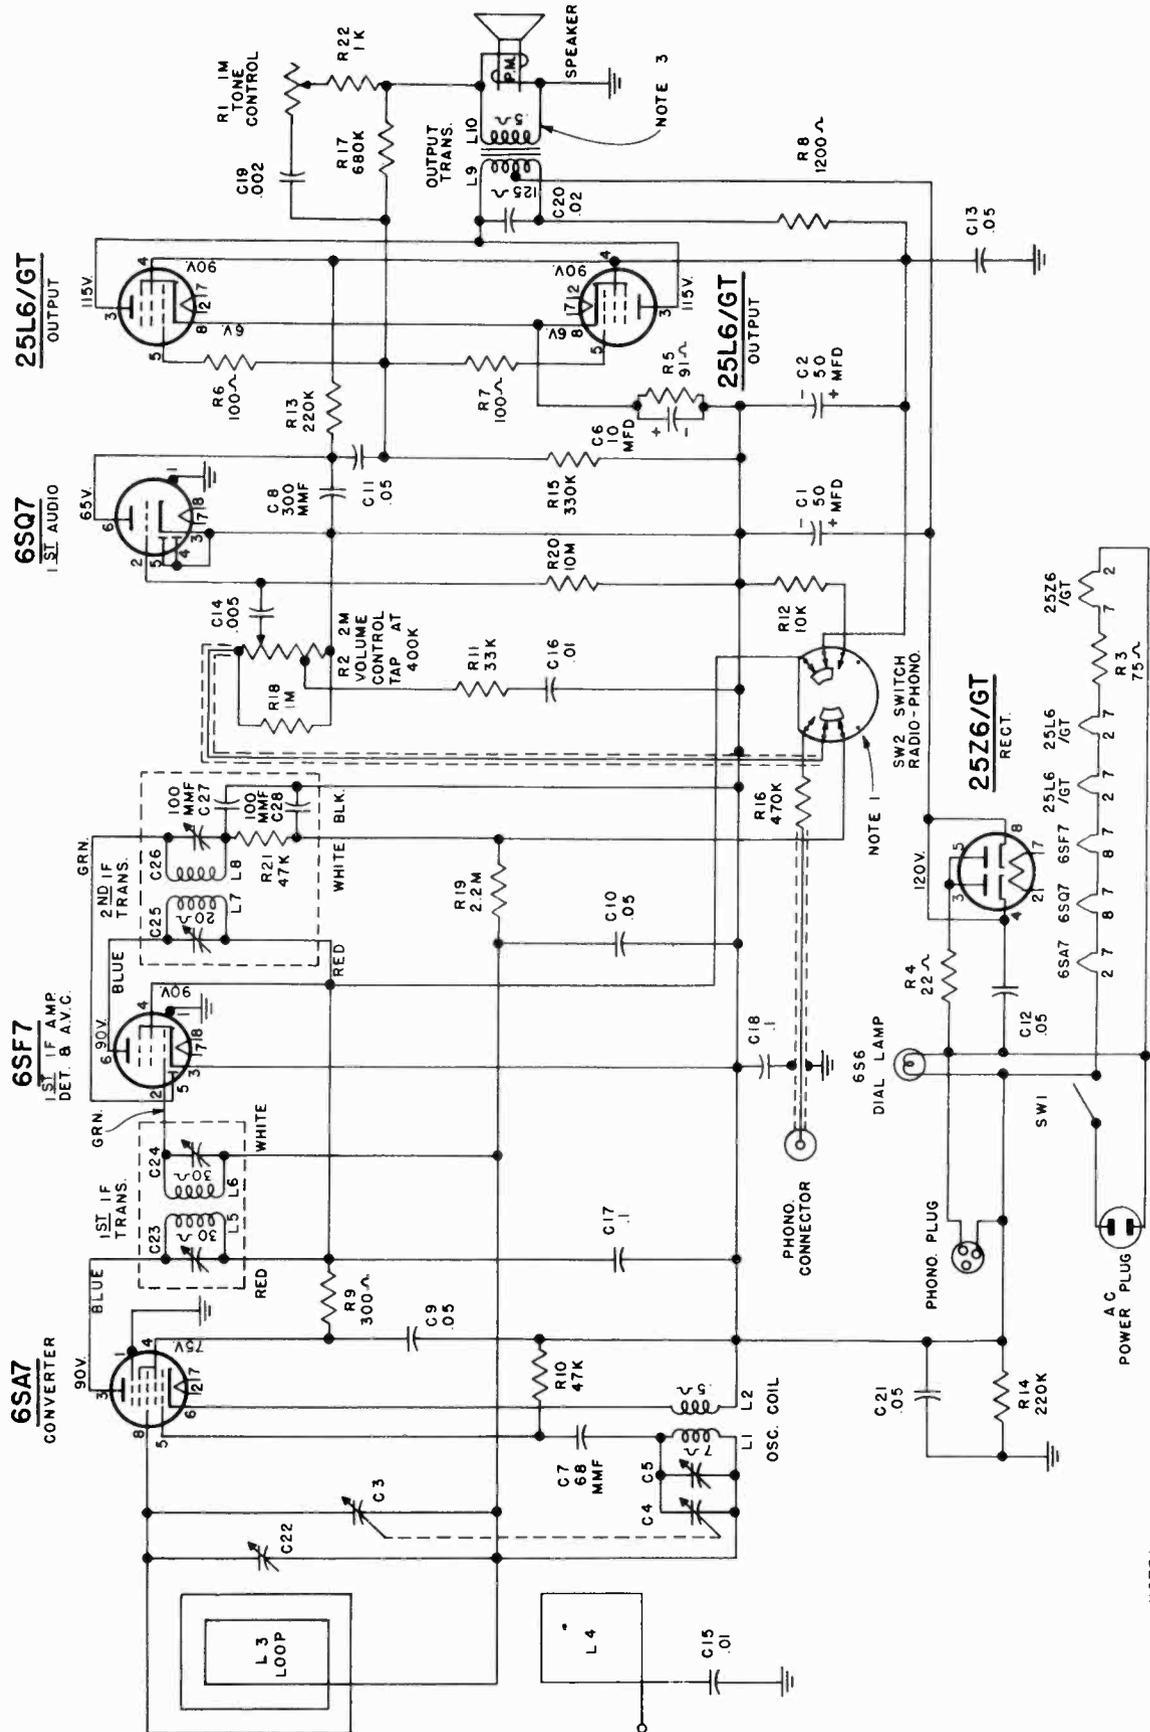

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid A. V. C. action.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	3E6 control grid through 0.1 mfd capacitor	455 kc	550 kc	Secondary and Primary trimmers of 2nd I-F trans. for max. output.
2	1LA6 control grid through 0.1 mfd capacitor	455 kc	550 kc	Secondary and Primary trimmers of 1st I-F trans. for max. output.
3	Antenna terminal through 200 mmf capacitor	455 kc	550 kc	"Peak" all I-F trimmers.
4	Antenna terminal through 200 mmf capacitor	1500 kc	1500 kc	Oscillator trimmer for max. output.
5	Antenna terminal through 200 mmf capacitor	1500 kc	1500 kc	Antenna trimmer for max. output.

PARTS LIST FOR MODEL H-178

When ordering parts specify model number of set in addition to part number and description of part.

Part No.	Description	Part No.	Description
V-3603	Background, dial	V-3489S-1	Foot, rubber
V-3593	Baffle, speaker	V-3592-2	Grille Cloth

ALIGNMENT

The use of an isolation transformer in the power line is recommended.

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid A. V. C. action.

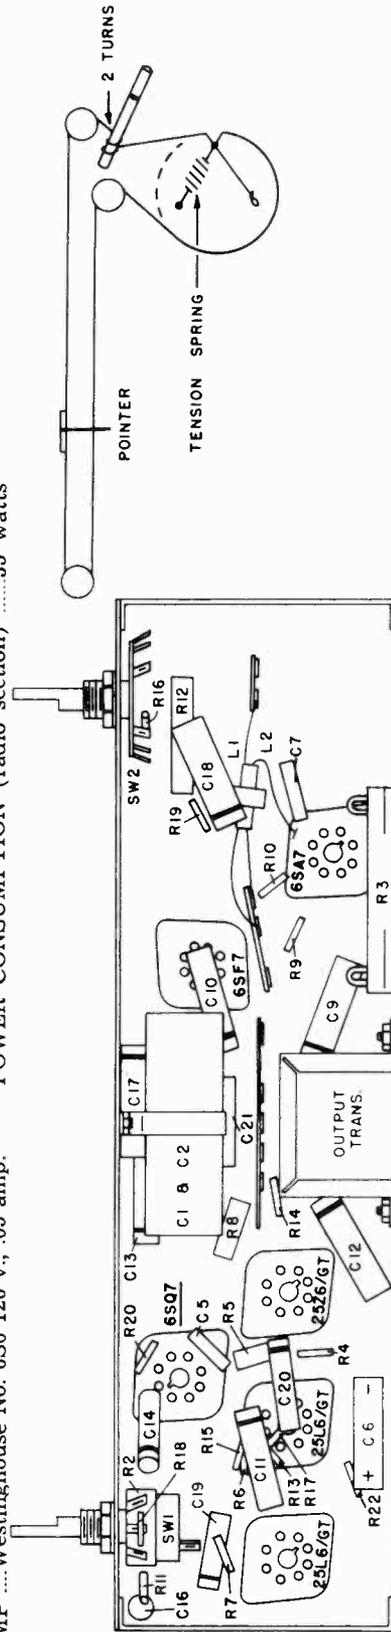

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Pin No. 2 of 6SF7 tube through a 200 mmf capacitor	455 kc	540 kc	Secondary and primary of 2nd I-F transformer for maximum output.
2	Stator of tuning capacitor (C3) through a 200 mmf capacitor	455 kc	540 kc	Secondary and primary of 1st I-F transformer for maximum output.
3	Recheck 1st and 2nd I-F transformers.			
4	Antenna terminal through a 200 mmf capacitor	1615 kc	1615 kc	Oscillator trimmer (C5) for maximum output.
5	Radiated signal (no actual connection)	1400 kc	1400 kc	Antenna trimmer (C22) for maximum output.

FREQUENCY RANGE540 to 1615 kc. **POWER OUTPUT:**
INTERMEDIATE FREQUENCY455 kc. Undistorted2 watts
 Maximum2.5 watts

4.	Radiated signal (no actual connection)	1400 kc	tune to signal	Ant. trimmer (C4) for max. output (rock-in adjustment)

NOTE:
 1. VOICE COIL DISCONNECTED.
 2. ALL VOLTAGES MEASURED FROM CIRCUIT (GND.) USING 20,000 OHM/VOLT METER—LINE VOLTAGE 117 V.A.C. VOLTAGES SHOULD BE AS SHOWN ± 20 PER CENT.

CHASSIS NO. V-2133

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer.

Connect an output meter across the speaker voice coil.

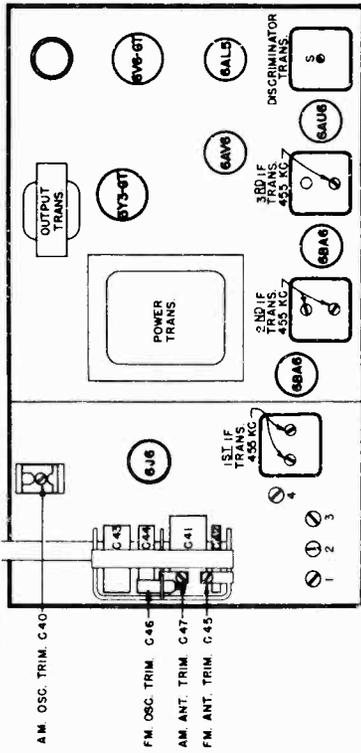

While making the following adjustments, keep the volume control set for maximum output and the signal generator attenuated to avoid AVC action.

WESTINGHOUSE ELECTRIC CORP.

ALIGNMENT
BROADCAST BAND

Completely mesh the tuning capacitor plates and set the dial pointer to the end mark on the dial scale.

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output, the tone control set for maximum treble, and the signal generator output attenuated to avoid A.V.C. action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM.			
2	Stator of tuning capacitor (C41) through a 0.1 mfd capacitor	455 kc	maximum capacity	455 kc. pri. of 3rd I-F trans., sec. and pri. of 2nd I-F trans., and sec. and pri. of 1st I-F trans. for max. output
NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.				
3	Radiated signal (no actual connection)	1600 kc	1600 kc	AM osc. trimmer (C40) for max. output
4	Radiated signal (no actual connection)	1400 kc	tune to signal	AM ant. trimmer (C47) for max. output (rock-in adjustment)

FM BAND

Do not align the 10.7 mc. I-F circuits until all 455 kc. I-F adjustments have been completed.

1	Set the band switch to FM.			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 percent) between pin #1 of the 6AL5 tube and ground as shown in Fig. 4.			
3	Connect a V.T.V.M. between points "X" and "Y" (see Fig. 4).			
4	Pin #1 of the 6BA6, 1st I-F amp. through a .001 mfd mica capacitor	10.7 mc	maximum capacity	Sec. of discriminator trans. for zero voltage (the voltage will go positive on one side of the correct setting and negative on the other side)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Pin #1 of the 6BA6, 1st I-F amp. through a .001 mfd mica capacitor	10.7 mc	maximum capacity	Pri. of discriminator trans., 10.7 mc. sec. and pri. of 3rd I-F trans., and 10.7 mc. sec. and pri. of 2nd I-F trans. for max. voltage
7	Using the same sig. generator and V.T.V.M. connections as in Step 6, adjust the sig. generator output until the V.T.V.M. indicates 4 volts. Use this sig. generator setting to perform Step 9.			
8	Reconnect the V.T.V.M. between points "X" and "Y".			
9	Pin #1 of the 6BA6, 1st I-F amp. through a .001 mfd mica capacitor	10.7 mc	maximum capacity	Sec. of discriminator trans. for zero voltage. The voltage will change polarity as the sec. is tuned through resonance — tune carefully for exact zero
10	Remove the two 100,000 ohm resistors which were inserted in Step 2.			
11	Reconnect the V.T.V.M. between point "Z" and ground.			
12	Pin #1 of the 6BA6, 1st I-F amp. through a .001 mfd mica capacitor	10.7 mc	maximum capacity	Recheck pri. of discriminator trans. for max. voltage
13	Stator of FM tuning capacitor (C42) through a .01 mfd mica capacitor	10.7 mc	maximum capacity	Sec. and pri. of 10.7 mc. 1st I-F trans. for max. voltage
14	Ant. terminal #2 through a 300 ohm resistor	108 mc	108 mc	FM osc. trimmer (C46) for max. voltage*
15	Ant. terminal #2 through a 300 ohm resistor	105 mc	tune to signal	FM ant. trimmer (C45) for max. voltage (rock-in adjustment)**

*After adjusting the oscillator trimmer at 108 mc., check dial calibration by tuning the receiver to an 88 mc. signal from the generator. If the dial pointer indicates 88 mc., no further oscillator adjustments are necessary. If the pointer is on the high frequency side of 88 mc., slightly expand the length of the oscillator coil (L8); if the pointer is on the low frequency side of 88 mc., slightly compress the oscillator coil. Re-adjust the oscillator trimmer at 108 mc., and again check the calibration. Repeat this process until calibration is correct.

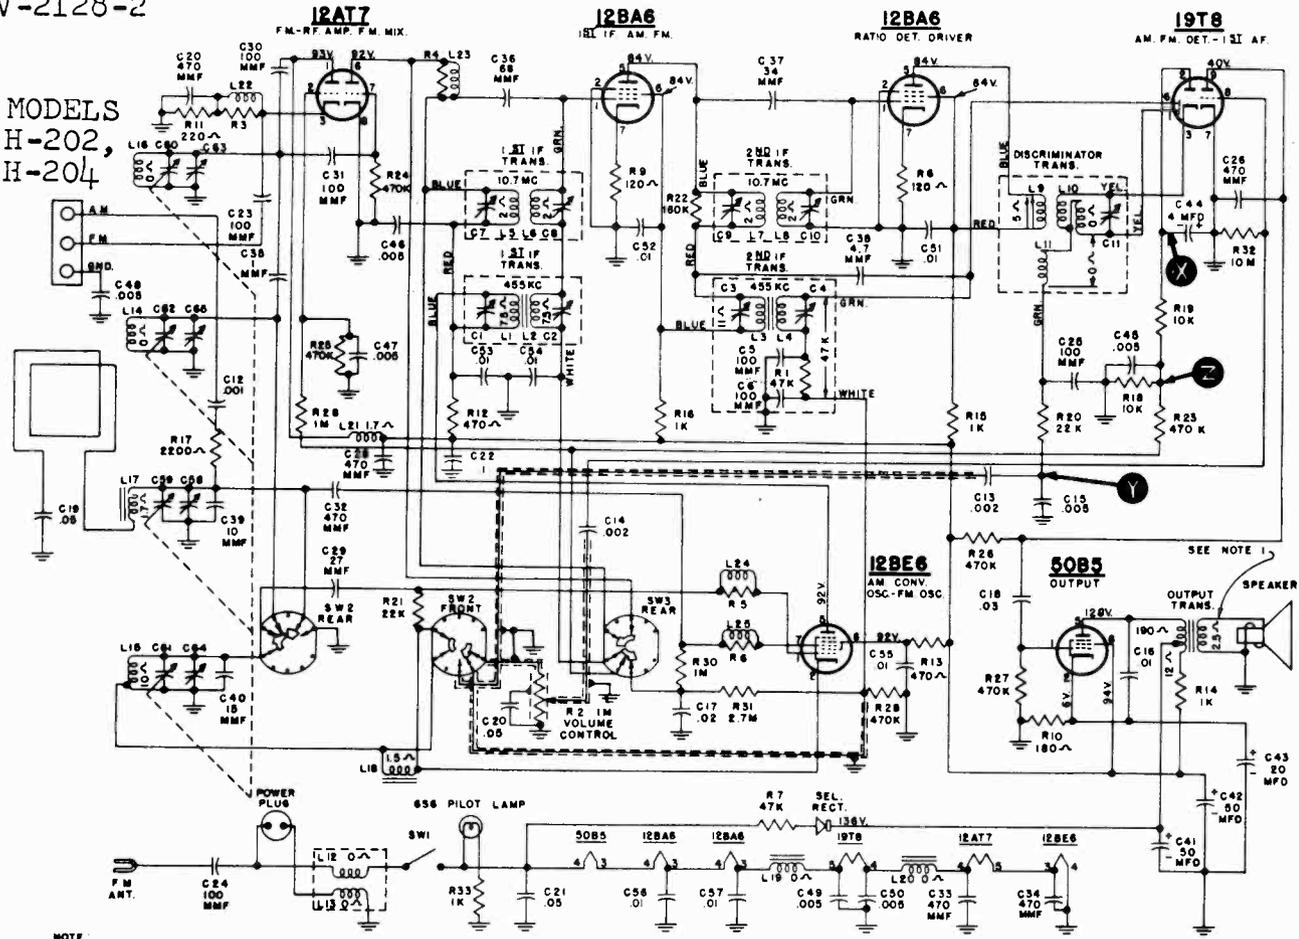

**After adjusting the antenna trimmer at 105 mc., check tracking by tuning to a 90 mc. signal from the generator and re-adjusting the antenna trimmer for max. output. If the peak setting is the same at 90 mc. as it was at 105 mc., no further adjustments are necessary. If the trimmer capacitance must be increased to obtain max. output at 90 mc., slightly compress the antenna coil (L5); if the capacitance must be decreased, slightly expand the coil. Re-adjust the antenna trimmer at 105 mc., and again check the tracking. Repeat this process until tracking is correct.

Undistorted 1 watt
 Maximum 2.1 watts

LOUDSPEAKER: 5" P.M.

OPERATING VOLTAGE:

105 to 120 volts 50 - 60 cycles
 A-C or 105 to 120 volts D-C.

POWER CONSUMPTION: 40 watts

Model H-204A is identical in external appearance with Model H-204. The similarity of these models extends also to the chassis, where the same chassis layout, adjustment points, and basic circuit exist. However, a low-impedance loop antenna is used in Model H-204, while the H-204A incorporates a high-impedance loop with a slightly different input circuit.

The service notes for Models H-202 and H-204, with the exception of the schematic diagram and a few of the items on the parts list, apply to the Model H-204A. The necessary parts information is given below,

With the exception of items that are equivalent to those listed below, all items that apply to the Model H-204, as listed in the H-202 and H-204 service notes, apply also to the Model H-204A.

The parts listed below apply only to Model H-204A.

Part No.	Description
V-6168-1	Cover Rivet Assembly, back (H-204A brown)
V-6168-2	Cover Rivet Assembly, back (H-204A ivory and green)
V-6061	Loop, antenna (H-204A)

WESTINGHOUSE ELECTRIC CORP.

MODELS H-202, H-204,
H-204A, CHASSIS
V-2128-2

CAUTION: One side of the power line is connected directly to the chassis in this model. Care must be exercised to avoid contacting the radio chassis and ground at the same time — **SERIOUS SHOCK MAY RESULT.** When making repairs or adjustments to the radio, it is recommended that the chassis be isolated from the power line by means of an isolation transformer.

ALIGNMENT BROADCAST BAND

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set band switch to AM.			
2	Pin #1 of 12BA6 (1st I-F) tube through a 0.1 mfd capacitor	455 kc	minimum capacity	Sec. and pri. of 455 kc 2nd I-F trans. for max. output
3	Stator of tuning capacitor (C59) through a 0.1 mfd capacitor	455 kc	minimum capacity	Sec. and pri. of 455 kc 1st I-F 1st I-F trans. for max. output
4	Radiated signal (no actual connection)	1615 kc	minimum capacity	AM osc. trimmer (C64) for max. output
5	Radiated signal (no actual connection)	1400 kc	1400 kc	AM ant. trimmer (C58) for max. output

FM BAND

Do not align 10.7 mc. I-F circuits until 455 kc I-F adjustments have been completed.

1	Set band switch to FM.			
2	Connect a V.T.V.M. between point "X" and ground (See Fig. 4).			
3	Pin #1 of 12BA6 (Ratio det. driver) tube through a .002 mfd capacitor	10.7 mc	minimum capacity	Pri. of discriminator trans. for max. voltage
4	With the V.T.V.M. and signal generator connected as in Step 3, adjust the output of the signal generator until a reading of 2.5 volts is obtained on the V.T.V.M. Use this signal generator setting when performing Step 6.			
5	Connect the V.T.V.M. between points "Y" and "Z" (See Fig. 4).			
6	Same as Step 3.	10.7 mc	minimum capacity	Sec. of discriminator trans. for zero voltage. The voltage will change polarity as the trimmer is tuned through resonance — tune carefully for zero
7	Reconnect the V.T.V.M. between point "X" and ground.			
8	Same as Step 3.	10.7 mc	minimum capacity	Pri. of discriminator trans. for max. voltage
9	Pin #1 of 12BA6 (1st I-F) tube through a .002 mfd capacitor	10.7 mc	minimum capacity	Sec. and pri. of 10.7 mc 2nd I-F trans. for max. voltage
10	Pin #7 of 12AT7 tube through a .002 mfd capacitor	10.7 mc	minimum capacity	Sec. and pri. of 10.7 mc 1st I-F trans. for max. voltage
NOTE: Do not attempt to peak the 2nd I-F transformer or discriminator transformer with the signal generator connected as in Step 10.				
11	FM ant. terminals through a 300 ohm non-inductive resistor	108 mc	minimum capacity	FM osc. trimmer (C65) for max. voltage
12	Check calibration as explained below*.			
13	Same as Step 11.	105 mc	105 mc	FM R-F trimmer (C63) for max. voltage (rock in adjustment)
14	Check tracking as explained below**.			

*To check dial calibration, completely mesh the tuning capacitor plates and vary the signal generator frequency until the signal is maximum on the V.T.V.M. If at this setting, the generator frequency is 88 mc., no further oscillator adjustments are required. If the generator is higher in frequency than 88 mc., slightly compress the FM oscillator coil (L14); if the generator frequency is lower than 88 mc., slightly expand the FM oscillator coil (L14). Repeat Steps 11 and 12 until the receiver tunes to 108 mc. with the tuning capacitor fully open and 88 mc. with the tuning capacitor fully closed.

**Tune the receiver to a 90 mc. signal from the generator and adjust the FM R-F trimmer for maximum voltage. If the "peak" setting is the same at 90 mc. as it was at 105 mc., no further adjustment is necessary. If the trimmer capacitance must be increased for maximum voltage at 90 mc., slightly compress the FM R-F coil (L16); if the trimmer capacitance must be decreased for maximum voltage at 90 mc., slightly expand the FM R-F coil (L16). Re-adjust the FM R-F trimmer at 105 mc., and again check the tracking. Repeat this process until the tracking is correct.

ALIGNMENT

BROADCAST BAND

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output, the tone control set for maximum treble, and the signal generator output attenuated to avoid A.V.C. action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM.			
2	Stator of tuning capacitor (C51) through a 0.1 mfd capacitor	455 kc.	maximum capacity	455 kc. pri. and sec. of 1st and 2nd I-F trans. for max. output
<p><i>NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.</i></p>				
3	Radiated signal (no actual connection)	1600 kc.	1600 kc.	AM osc. trimmer (C55) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM ant. trimmer (C57) for max. output (rock-in adjustment)

FM BAND

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to FM.			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 percent) between pin #7 of the 6AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V.T.V.M. between points "X" and "Y" (see schematic diagram).			
4	Stator of FM osc. section (C50) on tuning capacitor through a .01 mfd mica capacitor	10.7 mc.	maximum capacity	Sec. of ratio det. trans. for zero (use medium strength signal)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. and pri. and sec. of 10.7 mc. 1st and 2nd I-F trans. for max.
<p><i>NOTE: The pri. of the ratio det. trans. peaks in two places. Use the peak with the slug farthest out.</i></p>				
7	Reconnect the V.T.V.M. between points "X" and "Y", and increase the signal strength 2 times.			
8	Same as step 4	10.7 mc.	maximum capacity	Recheck sec. of ratio det. trans. for zero voltage
9	Reconnect the V.T.V.M. between point "Z" and ground.			
10	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2.			
12	FM ant. terminal through a 300 ohm non-inductive resistor	105 mc.	105 mc.	FM osc. trimmer (C54) for maximum output
13	Same as step 12	105 mc.	105 mc.	FM ant. trimmer (C56) for maximum output

WESTINGHOUSE ELECTRIC CORP. MODELS H-210, H-211,
CHASSIS V-21144,
V-21144-1

H-210

H-211

SPECIFICATIONS

FREQUENCY RANGE: 540 to 1600 kc.

INTERMEDIATE FREQUENCY: 455 kc.

TUBE COMPLEMENT:

- 1 12BE6 Converter
- 1 12BA6 I-F Amp.
- 1 12AT6 Det. and 1st A-F Amp.
- 1 50C5 Output Amp.
- 1 35W4 Rectifier

PILOT LAMP (H-211 only): Westinghouse No. 47

POWER OUTPUT:

- Undistorted 1 watt
- Maximum 1.5 watts

LOUDSPEAKER: 4" P.M.

OPERATING VOLTAGE: 105 to 125 volts 50 - 60 cycles A-C or D-C

POWER CONSUMPTION: 35 watts

V-21144-1

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer.

Make certain that the dial pointer is correctly positioned on the dial cord.

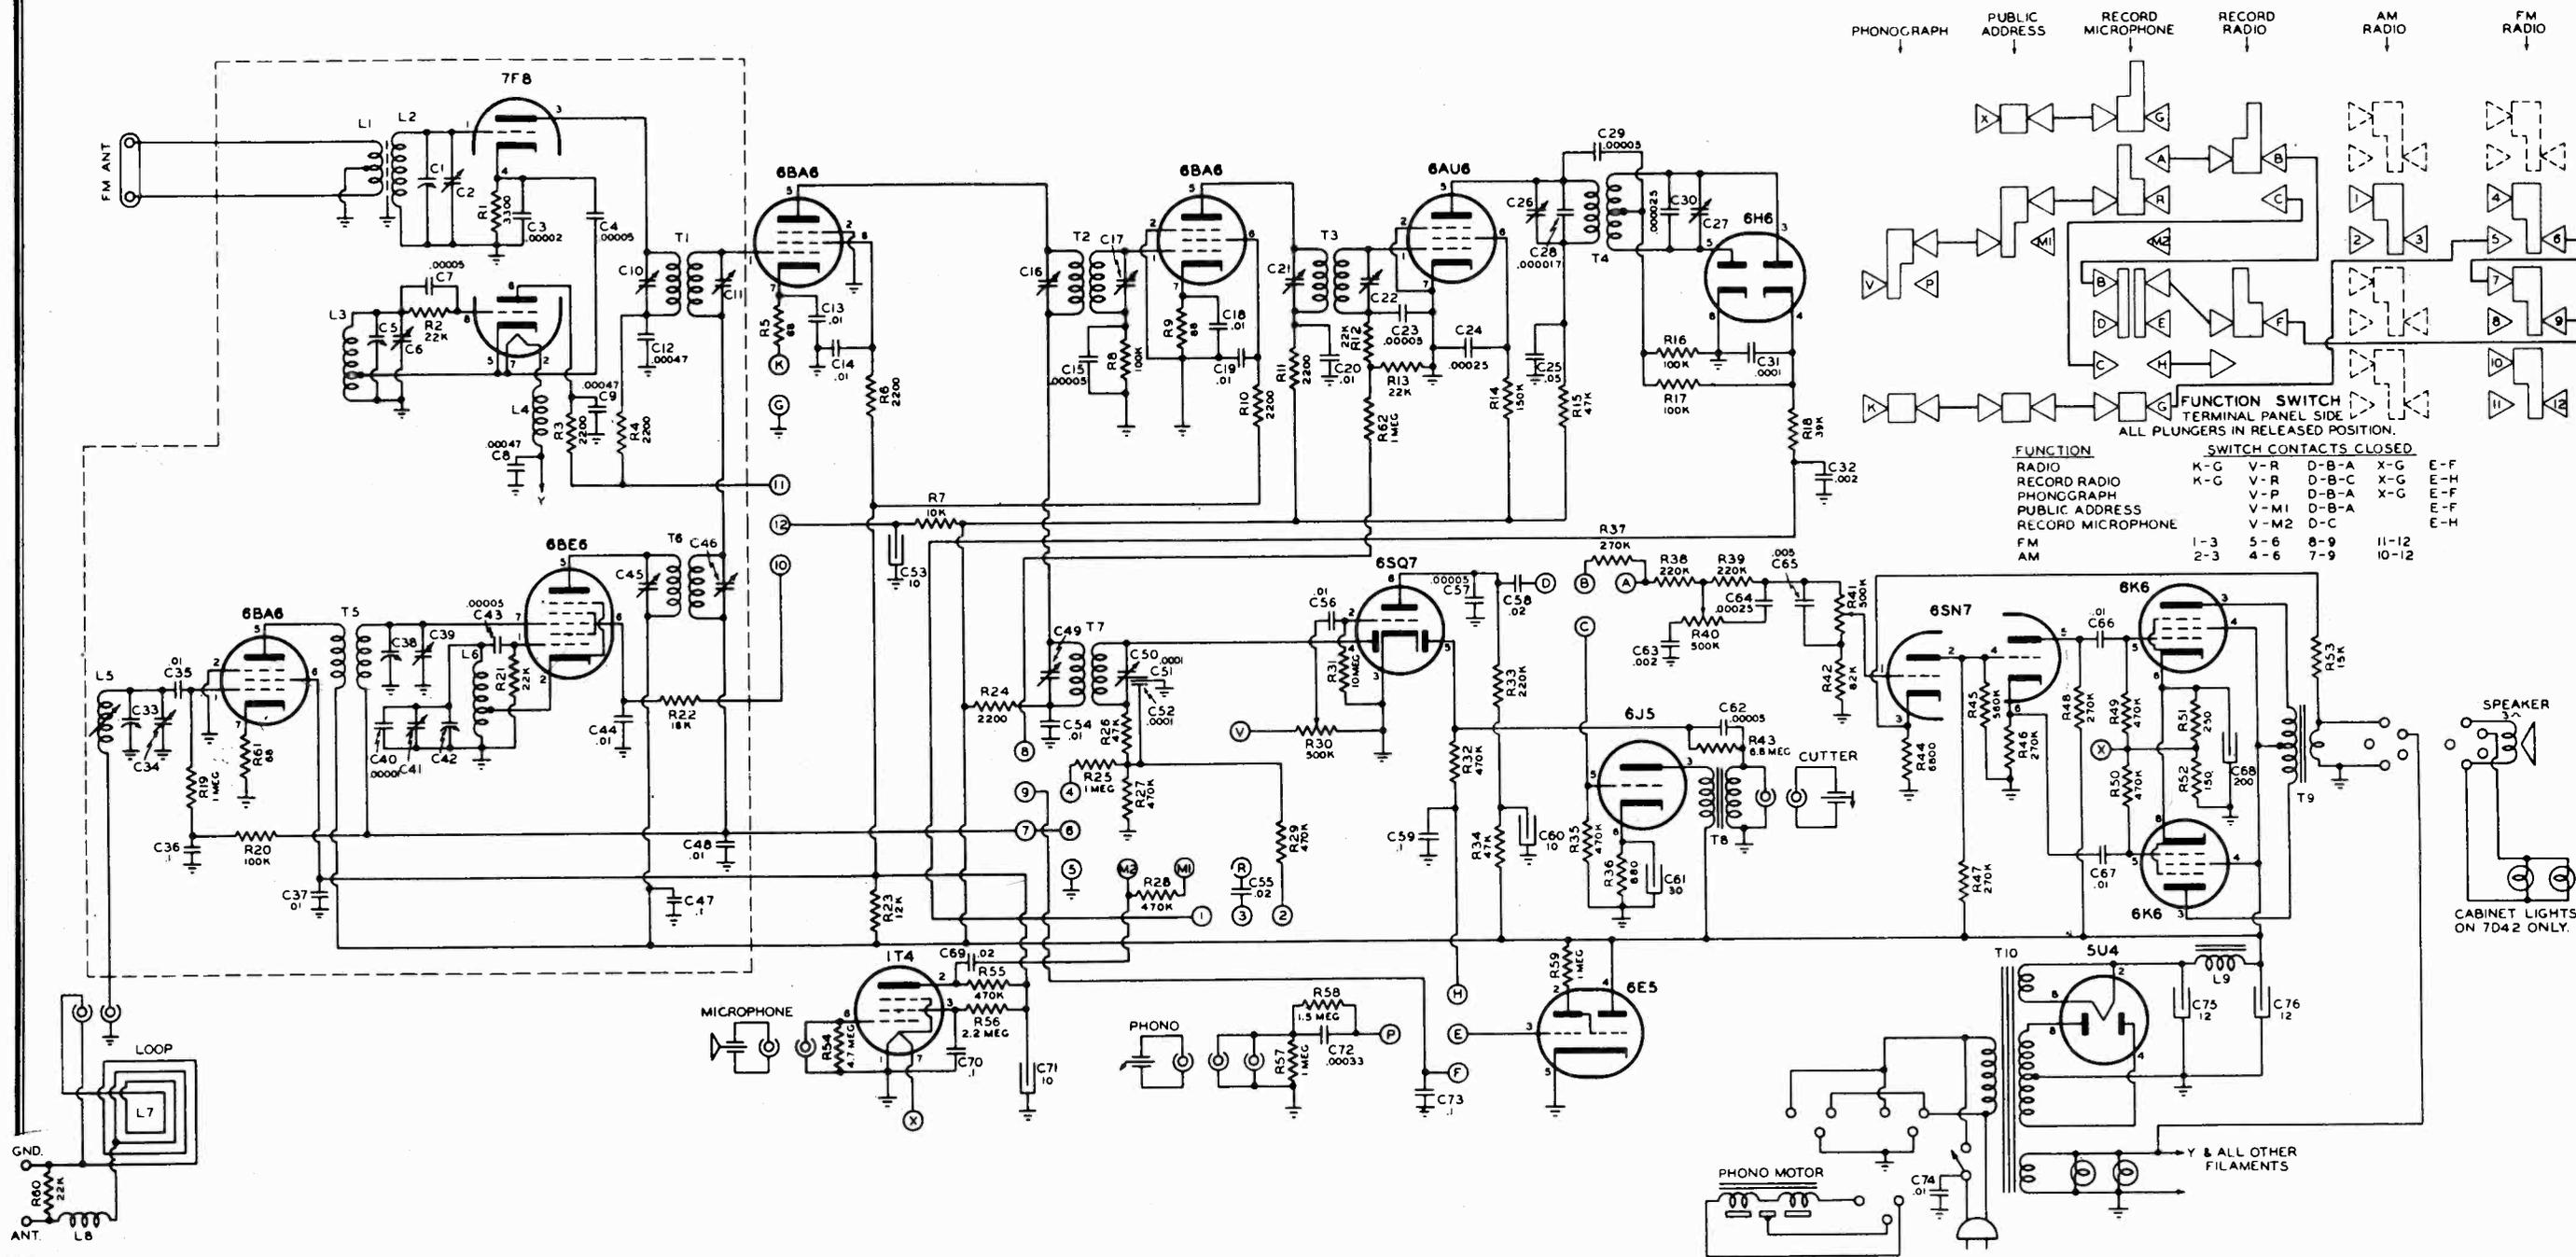

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1.	Stator of R-F tuning capacitor (C7) through a 0.1 mfd capacitor	455 kc.	maximum capacity	Pri. and sec. of 1st and 2nd I-F transformers for max. output
<p><i>NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output to use the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.</i></p>				
2.	Radiated signal (no actual connection)	1615 kc.	minimum capacity	Osc. trimmer (C10) for max. output
3.	Radiated signal (no actual connection)	1400 kc.	1400 kc.	Ant. trimmer (C8) for max. output

PARTS LIST FOR MODELS H-210 AND H-211

When ordering parts, specify model number of set in addition to part number and description of part.

SCALES USED 3-30-150-300 * AC VOLTAGE

Radio Feed Through on Microphone Recording.

NOTE: AM-FM SWITCH (S2) SHOWN IN FM POSITION

In some localities where signal strength is great, difficulty has been encountered with the radio signal "leaking through" on Microphone Recording. This trouble is eliminated by removing the orange wire connecting pin No. 4 on the 6J7 tube socket to terminal J on the push-button switch.

All 7E40 and 7E44 models with serial numbers above 803,108 will have this lead removed.

On all chassis with serial number 804,045 and up, R53 in the phono circuit has been changed from 820 K to 470 K. This compensates for variance in values of the volume control and provides greater voltage to the audio section of the 65Q7 phono amplifier tube.

If low phonograph gain is encountered on chassis with serial numbers below 804,045, R53 should be changed to 470 K to increase the gain.

WILCOX-GAY CORP.

MODELS 7E40,
7E44

A loading coil, can be substituted for the loop for bench alignment but the final adjustment of trimmer C-4 and L.F. antenna coil slug should be made with the chassis in cabinet. To make this loading coil, close wind 50 turns of #24 enamel wire on a 3/4" O.D. bakelite form. An antenna can be coupled to the ungrounded side of this coil through a .0001 mfd. condenser.

SIGNAL GENERATOR	DIAL	TRIMMER
FREQUENCY	SETTING	
1400 K.C.	1400 K.C.	Osc. (C-5)
1400 K.C.	1400 K.C.	Det. (C-4)
600 K.C.	600 K.C.	L.F. ANT.-AM

Note: Repeat procedure to obtain greatest accuracy in the adjustment of the trimmer condensers.

ALIGNMENT OF FREQUENCY MODULATION (FM) BAND.

An unmodulated signal generator with output at 10.7 MC and 100 MC is required for FM alignment. A vacuum tube voltmeter or a high resistance voltmeter, at least 20,000 OHMS per volt, is required to measure limiter grid voltage and discriminator output voltage.

FM alignment can be accomplished with an FM signal generator and oscilloscope. Instructions for this type of alignment are furnished by the manufacturers of FM signal generators.

I. F. SECTION

1. Connect 10.7 MC Signal Generator across ANT.FM section, (copper plates), of tuning condenser gang.
2. Connect VTVM or high resistance voltmeter across R-34 with positive terminal to ground.
3. Adjust trimmers C58, C57, C56, C55, C54 and C53 in order listed for maximum voltmeter reading.

Note: Reduce output from signal generator as alignment progresses so that the limiter grid voltage does not exceed 5 volts.

4. With signal generator connected as above, remove voltmeter from limiter grid and connect across discriminator load resistor, R39.
5. Adjust trimmer C-59 on Disc. Transformer for maximum voltmeter reading.
6. Connect voltmeter from 6H6 pin #4 to ground.
7. Adjust trimmer C-60 on Disc. Transformer for zero reading on voltmeter.

Note: When trimmer C-60 is adjusted correctly, slight detuning will give a positive voltage reading in one direction and a negative reading in the other.

R. F. SECTION

1. Disconnect FM antenna and connect signal generator with 150 ohm resistor in each lead to FM ANT terminals.
2. Connect voltmeter across R-34.
3. Set signal generator and radio dial pointer at 100 MC.
4. Adjust trimmer C-3 (OSC FM) to bring in signal.

Note: Two settings of this trimmer will give a response. The correct adjustment is the one for least capacity.

5. Adjust trimmer C-2 (ANT FM) for maximum voltmeter reading.

(Serial Nos. 800,000 to 801,055 Incl.)

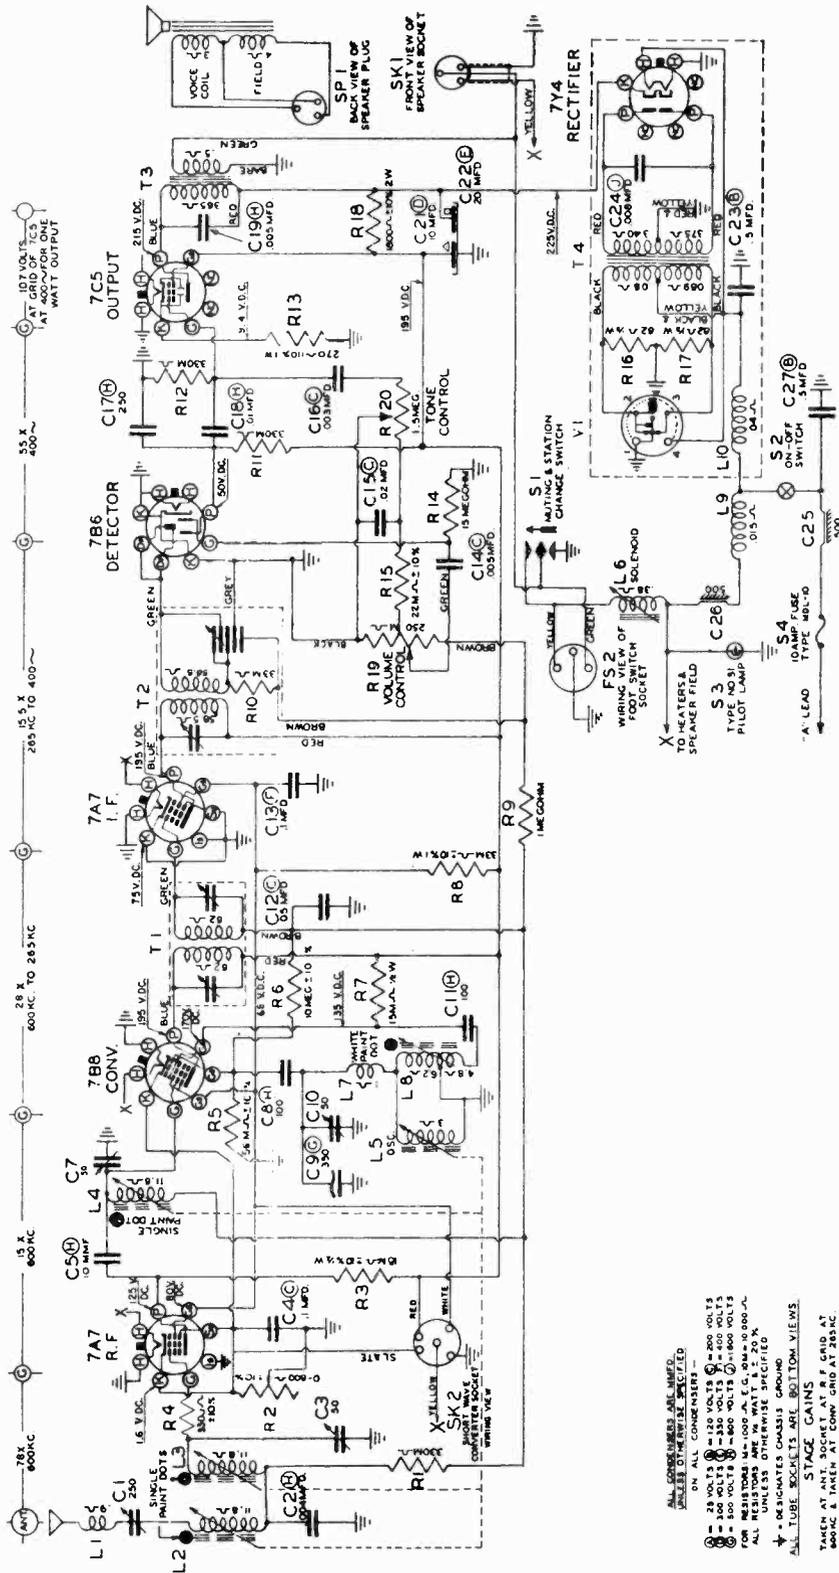

Due to variance in tube characteristics, AC hum in some cases was objectionable on the first production run on 7E Models.

On all chassis with serial numbers above 801,055 the plate resistor (R46) of the audio section of the 6SN7 GT/G tube is connected to the junction of Resistor (R27) and Filter Capacitor (C32) instead of directly to the plate supply.

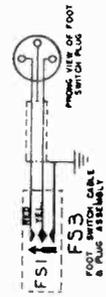

This change, shown below, takes care of tube variances and should be made, when necessary, in the field.

Original Connection Shown by Dotted Lines.

SETTING THE AUTOMATIC TUNER

Pressing the Push-Bar at the right below the dial repeatedly will cause the tuning mechanism to change through a cycle of six positions. Five of the automatic positions may be set for favorite local stations while the sixth position, at which "M" appears on the indicator drum, is used for selecting stations manually.

Allow the receiver to operate for at least fifteen minutes to bring the operating temperature up to normal before making the following automatic tuning settings.

Using "M" position as a reference point, the remaining five positions may be adjusted in succession to any desired dial setting. Setting these stations in sequence according to their frequencies beginning at the lowest frequency for number 1, and progressing through to the high frequency end of the dial for number 5 is the recommended practice to simplify the identification of each automatic tuned station.

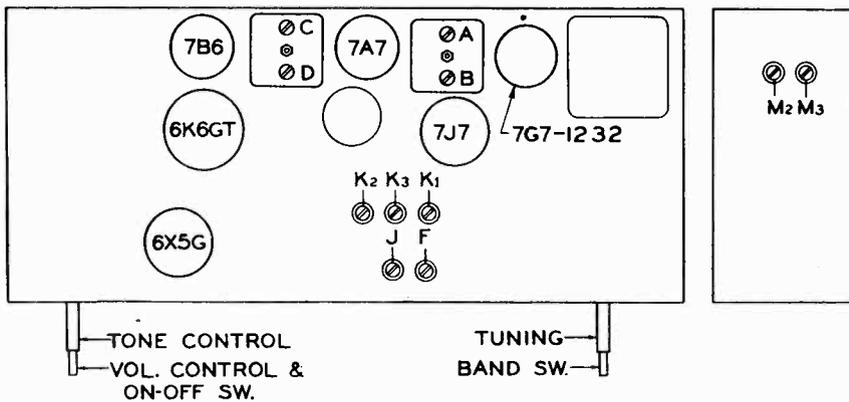

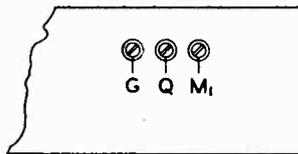

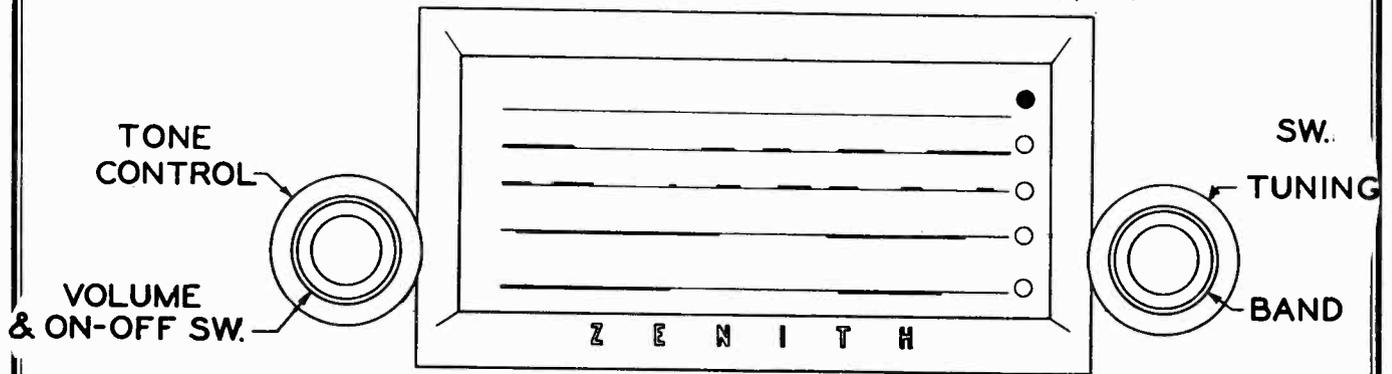

1. Press station selector bar until number 1 appears in station indicator window.
2. Pull manual tuning knob outward to engage the automatic mechanism.
3. Select the station desired and tune to its frequency by turning tuning knob. Tune very carefully for clearest reception.
4. Press station selector bar, pull manual tuning knob outward, and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

NOTE: When "M" appears in the station indicator window, the manual tuning knob must be pulled outward and rotated to select the stations manually.

POWER

Under no circumstances should this receiver be connected to direct current (D.C.).

6B16AT — This chassis is designed to operate on 25 cycles alternating current (A.C.) and may be adjusted for use on 110-125-190-220 or 240 volts by means of the switch on top of the transformer.

6B16BT — This chassis is designed to operate on 50 to 100 cycle alternating current (A.C.) and may be adjusted for use on either 115 or 225 volts by means of the switch on the power transformer.

6B16CT — This chassis is designed to operate on 50 to 60 cycle alternating current (A.C.) and may be adjusted for use on either 95, 115 or 150 volts by means of the switch on the power transformer.

The total power consumption is 50 watts.

TUBES

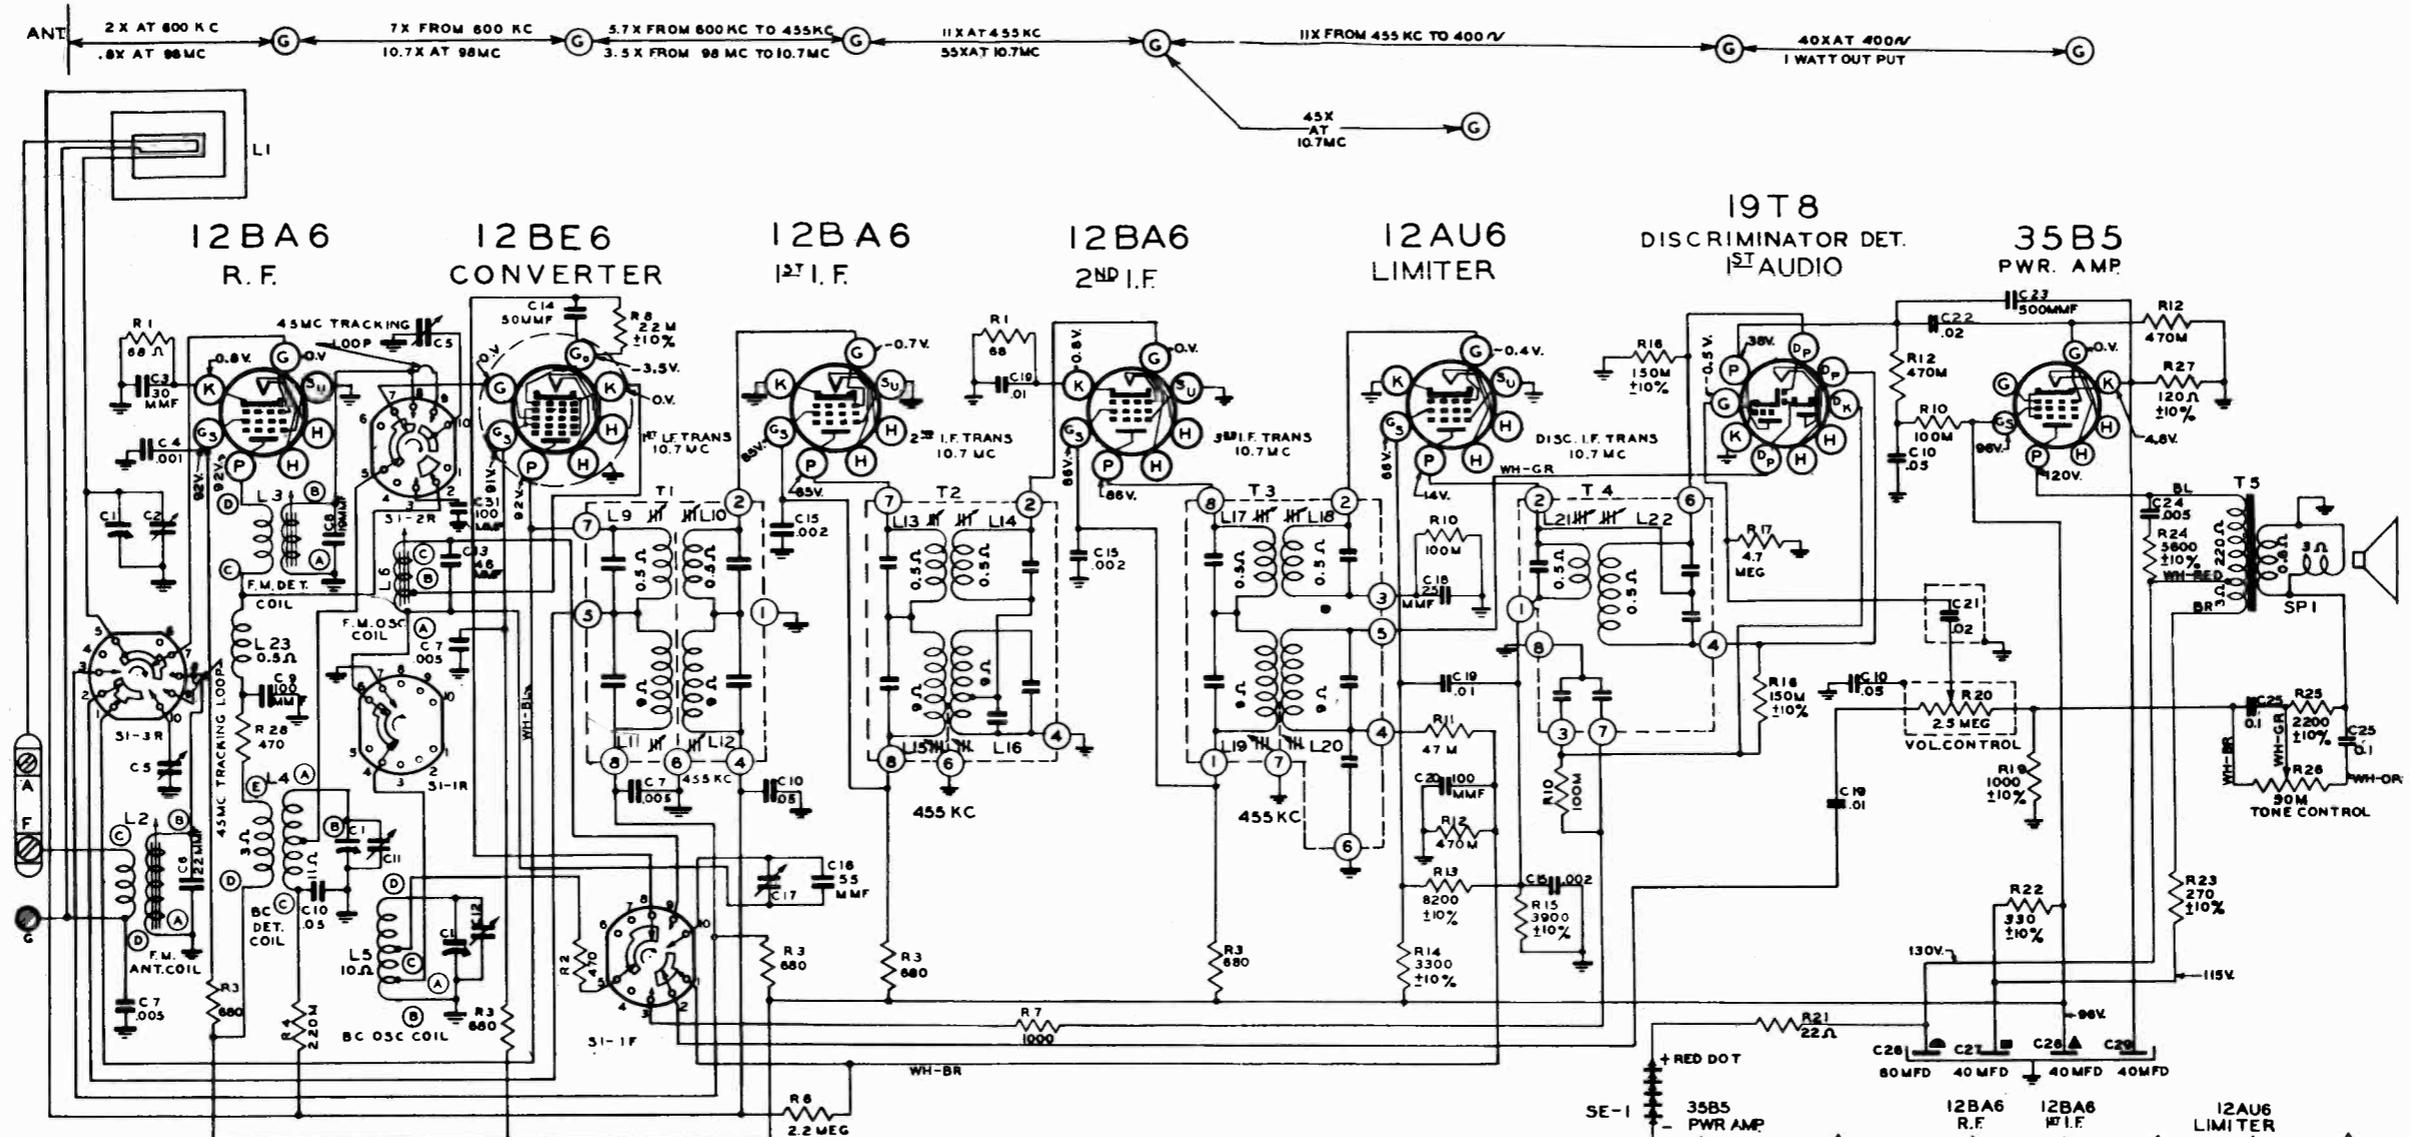

The following tubes are used — (see Fig. 2):

- 7G7/1232 - 7J7 - 7A7 - 7B6 -
- 6K6GT - 6X5G

TUBE AND TRIMMER LOCATION

The 7E01 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands. When adjustments are made on the 7E01 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F.'s. Observe the same precautions when making adjustments.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

The tone control is of the low impedance type in which a portion of the audio voltage is taken from the voice coil and fed back into the grid of the first audio. The voltage is fed back out of phase. R25, 26 and C25 determine the characteristic of the feedback voltage. A much greater variation of tone can be had by this system.

The filter circuits of chassis 7E01 incorporate new features. An examination of the schematic drawing will show the output transformer tapped slightly off center. This tap is the B+ connection from filter capacitor C26 off the selenium rectifier to the 35B5 plate. The lower connection of the output transformer feeds B+ to the rest of the tubes in the receiver. Current flowing through the upper windings of the output transformer to the 35B5 produces a magnetic field which is 180° out of phase with the magnetic field produced by current flowing in the opposite direction through the output transformer to the rest of the receiver, therefore, most of the AC hum is cancelled. Further reduction of hum is accomplished by filtering through resistors R22 and R23 capacitors C27 and C28.

This development in filtering systems allows a higher effective plate voltage on the 35B5 for increased power output.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 95-1035 be sure to add the speaker code letter to the transformer Part Number when ordering replacements.

9 (c) (d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.		Set Oscillator to dial scale.
10 (c) (d)	Antenna Post F (Re- move line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.		Align det. and ant. stages to maximum reading.
11 (c)		270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C17	Set oscillator to dial scale.
12 (c)		270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C5 Det., C5 Ant.	Align detector and ant. stages for maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments. The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter Lug 3 on 3rd IF transformer (Limiter Grid).

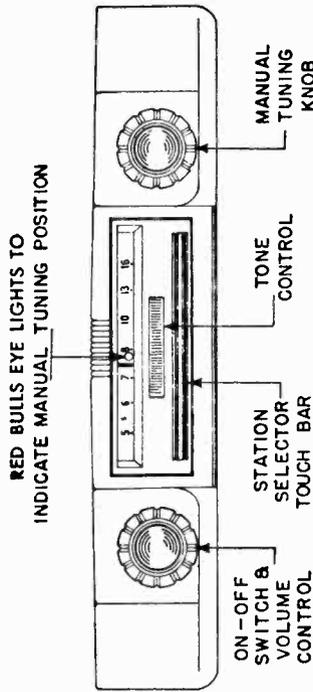

(d) Loosen Slugs by applying a hot iron to the cement.

OPERATING INSTRUCTIONS

LINCOLN FIG. 1A

LINCOLN CONTINENTAL FIG. 1B

**SCHEMATIC DIAGRAM FOR 7 TUBE
LINCOLN EXPORT 7ML780E**

I.F. 263 KC
TUNING RANGE 540KC TO 1600 KC

MODEL 7ML780E,
Lincoln

ZENITH RADIO CORP.

Lincoln Receiver Installation

1—Remove the cardboard cover from the speaker hole in the center of the instrument panel. Do not discard the nuts. Remove the bezel from the instrument panel by loosening the nuts on the underside.

2—Remove the protective cover from the speaker. Install the speaker on the rear of the grille so the cable is toward the left. Use the nuts that held the instrument panel hole cover in place.

3—Hang the hook bolts "A" in the holes provided for them in the dash so that the hooks are turned away from the receiver.

4—Place the receiver in position and slip the threaded end of the hook bolts through the upper hanger brackets.

5—Apply lock washers "B" and wing nuts "C" to the hook bolts and tighten them sufficiently to hold the receiver in place while installing the lower support brackets "D." Fasten the tapped end of the brackets to the instrument panel, using spacer washers "F," lock washers "B", and oval head screws "E." Fasten the other end of the bracket to the lower angle bracket of the receiver. Tighten all screws and nuts so that the receiver is held firmly in place (Fig. 2).

6—Connect the "A" lead to the battery terminal of the circuit breaker on the firewall. (Fig. 3.)

7—Connect the speaker cable and the antenna lead-in cable to the receiver and turn the power on.

8—Place the escutcheon plate, furnished with the receiver, over the tuning and volume control shafts and fasten it in place with the two 8/32" flat head screws furnished in the installation kit.

9—Fit tuning and volume control knobs to their respective shafts.

NOTE: Tuning control knob is fastened to the shaft with a set screw. Shaft has a milled recess for the screw.

Lincoln Continental Receiver Installation

The Continental Radio installation is similar to the Lincoln installation with the exception of the speaker.

To install the Continental speaker, remove the speaker grille which is held in place by four nuts on the back of the instrument panel. Place the speaker in position through the front of instrument panel so the cable is to the left. Fasten securely with the four No. 10/32 machine screws and lock washers. Replace the grille and proceed with the installation of the receiver as instructed under Lincoln Receiver installation. Note position of bracket D in figure 2A.

Foot Control Switch Installation

1—Remove the floor mat around the clutch and brake pedals.

2—Drill a hole in each of the three extrusions in the floor, between the clutch and brake pedals, with a No. 27 drill. (Fig. 3.)

3—Fasten the foot control switch in place with the sheet metal screws furnished. Dress the cable so that the plug can be inserted into the foot switch cable receptacle at the left side of the receiver as shown in figure 2.

4—Cut a hole in the floor mat for the foot switch button. Install the foot switch eyelet (furnished in the installation kit) in the hole. Replace the floor mat. A piece of 1 1/8" pipe that has been sharpened on the inside of one end may be used to cut the hole.

ANTENNA. The new Lincoln antenna is especially designed to work satisfactorily with this receiver. The installation instructions are included with the antenna.

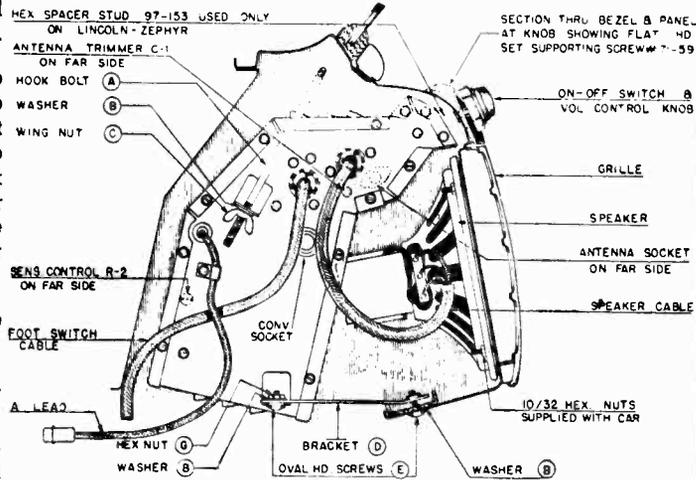

FIG. 2

IMPORTANT: 1200 K.C. ANTENNA ADJUSTMENT. After the receiver has operated for approximately 15 minutes, tune in a weak station near 1200 Kc. Adjust the antenna trimmer (C1, Fig. 2) for maximum signal.

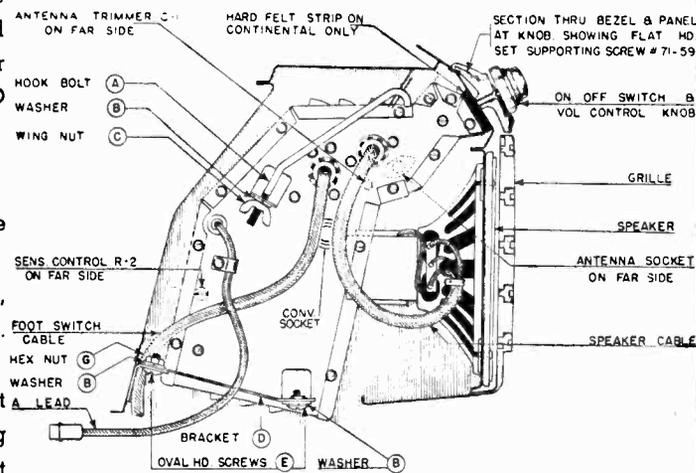

FIG. 2A

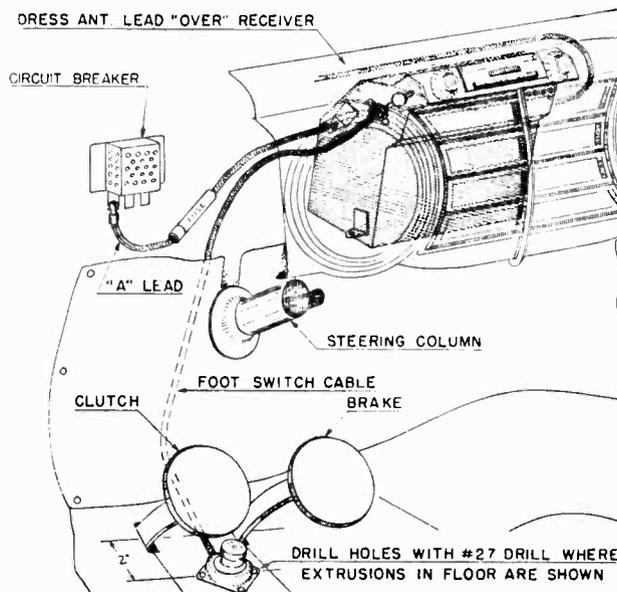

FIG. 3

Setting the Touch-Bar Tuning

Pressing the station selector touch-bar six times will cause the tuning mechanism to change through a cycle of six positions. Five of the Adjust-O-Matic positions may be set for favorite local stations. A red dot will appear in the tuning scale background when the Adjust-O-Matic is in the sixth position. This position may be used for selecting stations manually.

Using the manual (DIAL) position as a reference point, the remaining five positions may be adjusted in succession to any desired dial settings. Setting the stations in sequence according to their frequencies, beginning at the low frequency and progressing through to the high frequency end of the dial, is the recommended practice for simplifying the identification of each Adjust-O-Matic station.

Turn the receiver on and allow it to operate for at least fifteen minutes to bring the temperature up to normal before making the following Adjust-O-Matic settings.

1—Press station selector touch-bar (Figs. 1A and 1B) until red dot appears in dial scale background. Press the touch-bar once more to advance Adjust-O-Matic mechanism to No. 1 position.

2—Pull manual tuning knob outward to engage the Adjust-O-Matic mechanism.

3—Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception.

CAUTION: DO NOT ATTEMPT TO FORCE THE KNOB IN. The knob will automatically return to the "IN" position when the station selector touch bar or the foot switch is operated.

4—Press station selector bar, pull tuning knob outward, and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5. Note: When the red dot appears in the tuning scale background, the manual tuning knob must be pulled outward and rotated to select the stations manually.

Interference Elimination

IMPORTANT: Use the utmost care in the following operations to insure freedom from interference. Be sure that clean contacts are made when connecting condensers in the car. If necessary, clean away paint or dirt with emery paper to make good ground. Tighten all bolts and nuts securely.

1. Mount the voltage regulator condenser No. 22-1192 and the ground strap No. S-9343 on "ground" terminal of the voltage regulator. (Fig. 4.) Connect the lead of the condenser to the ARM. terminal of the voltage regulator. Connect the end of the ground strap to the lower, left hand voltage regulator mounting screw. (Fig. 4.)

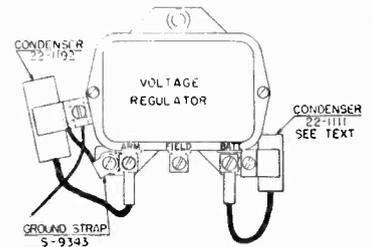

FIG. 4

2. Mount condenser No. 22-1111 under the lower right hand voltage regulator mounting bolt, and connect the lead to the BATT. terminal of the voltage regulator. (Fig. 4.)

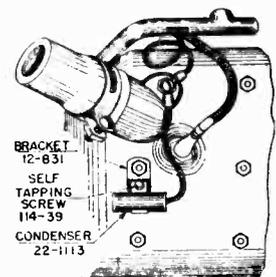

FIG. 5

3. Install the water temperature gauge condenser No. 22-1113 with its separate bracket (which fastens under one of the cylinder head nuts.) (Fig. 5.)

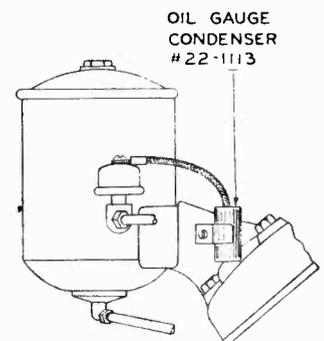

FIG. 6

4. Install the condenser No. 22-1113 on the oil gauge unit. (Fig. 6.)

5. Install the motor hood grounding spring. (Fig. 7.)

ZENITH RADIO CORP.

TUBE, TRIMMER LOCATION AND DIAL CABLE DRAWING

The 8E20 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands. The Radiorgan tone control is of the low impedance type in which a portion of the audio voltage is taken from the speaker voice coil and fed back out of phase into the grid of the first audio. The characteristic of the feedback voltage is determined by the setting of the Radiorgan buttons. To attenuate the high notes, more highs are fed back. To attenuate the low notes, more lows are fed back. For normal reproduction, both highs and lows are fed back and results in no overall change in tone.

AV Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

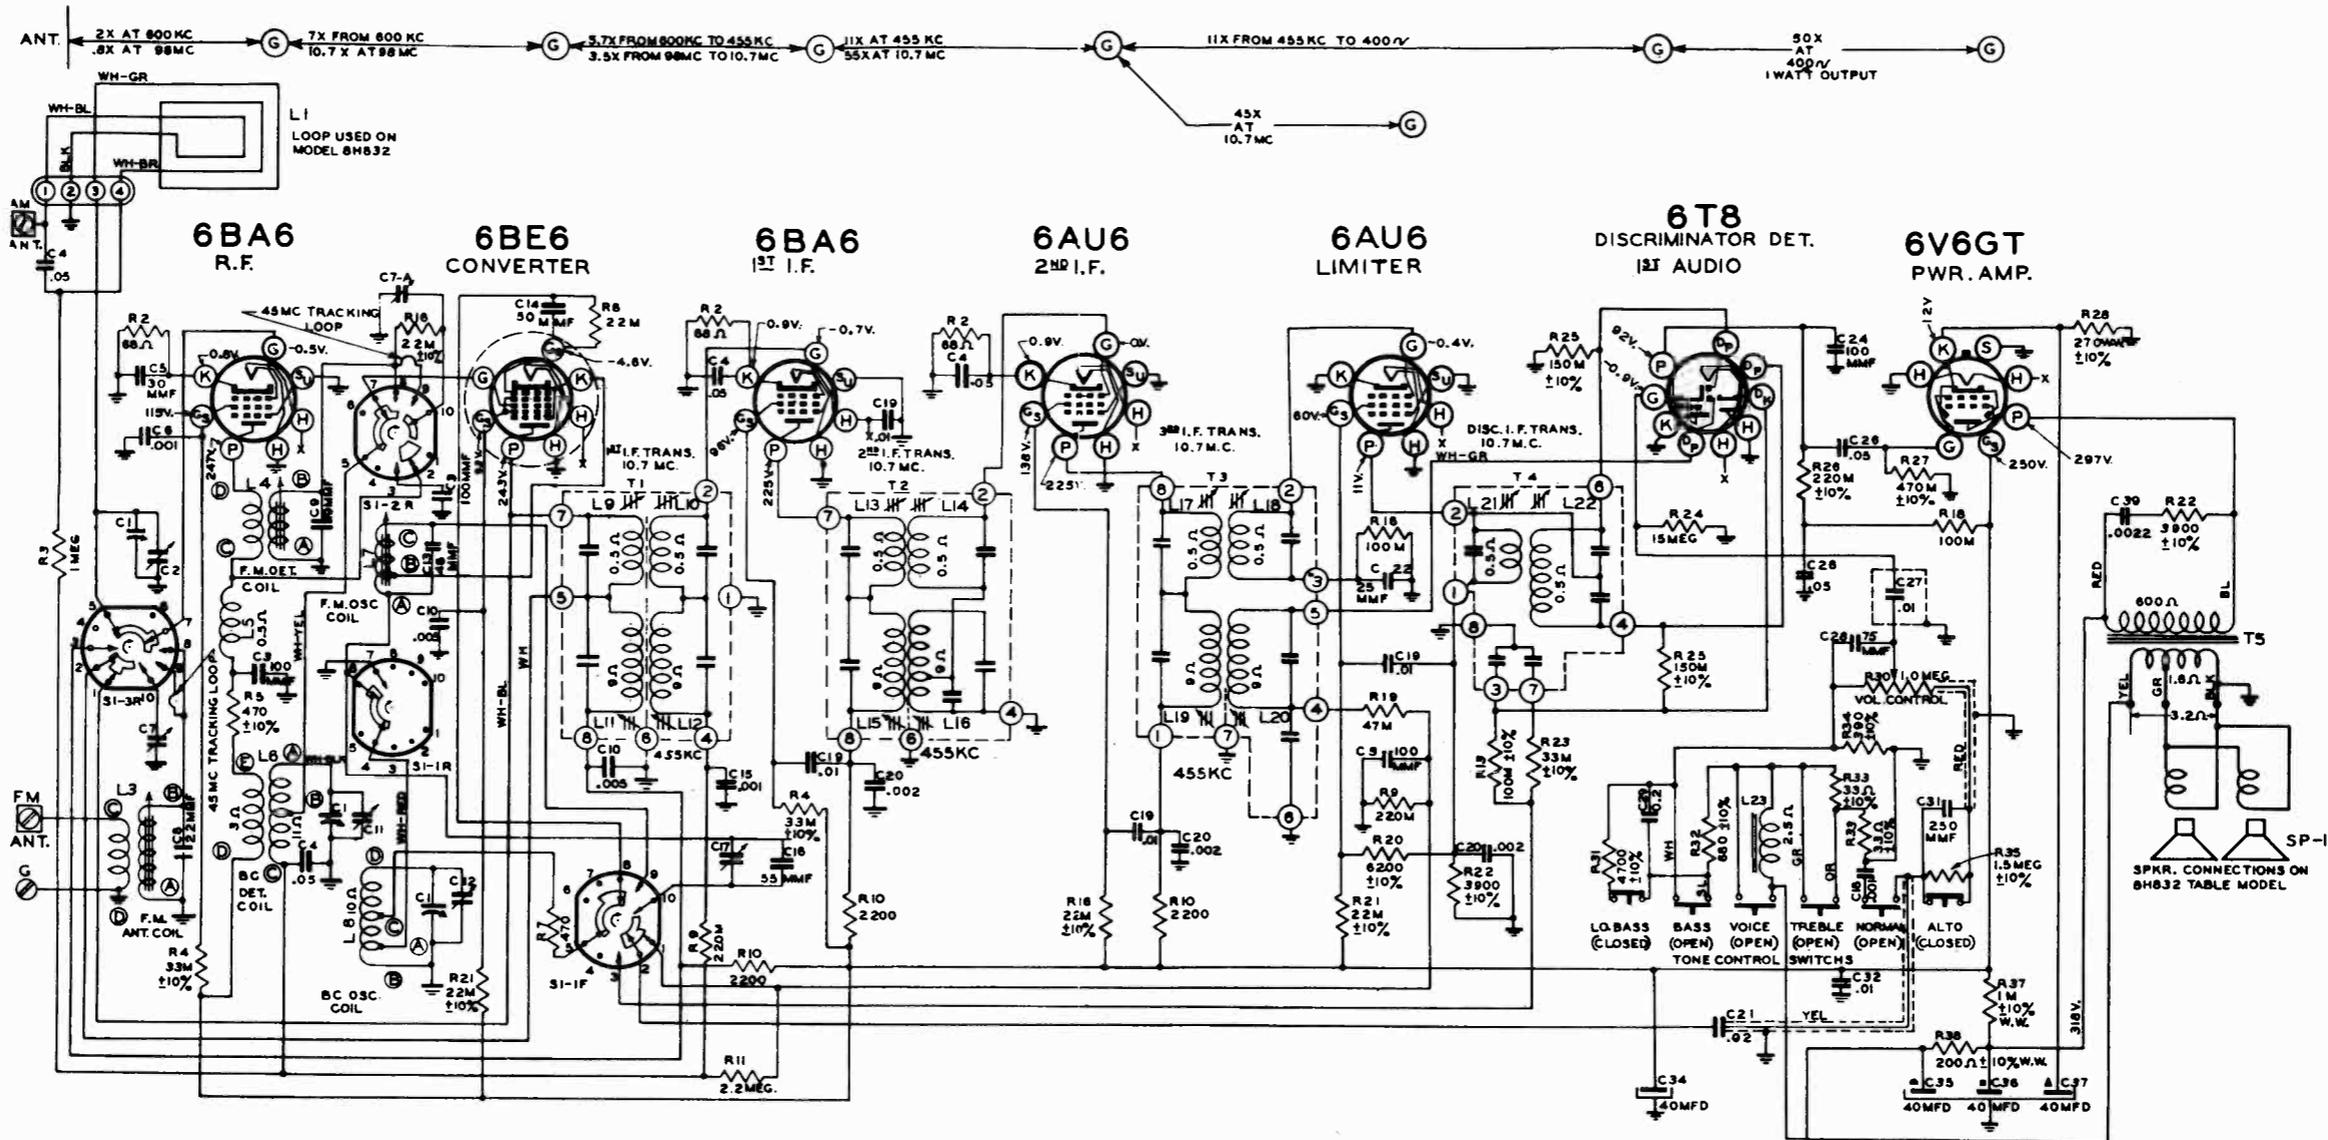

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

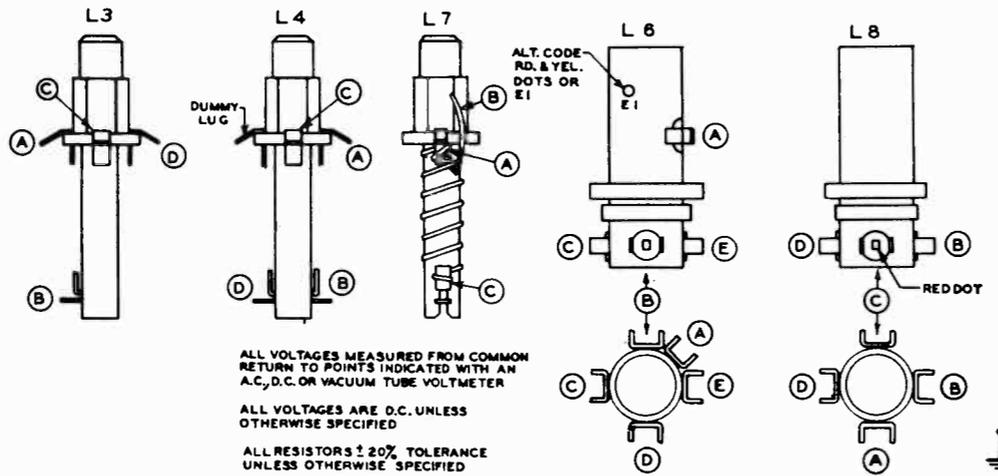

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 95-1096. Be sure to add the speaker code letter to the transformer Part Number when ordering replacements.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter Lug 3 on 3rd IF transformer (Limiter Grid).

(d) Loosen Slugs by applying a hot iron to the cement.

TUBE AND TRIMMER LOCATION

TO THE SERVICE MAN:

The 9E21 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands. The Radiorgan tone control is of the low impedance type in which a portion of the audio voltage is taken from the speaker voice coil and fed back out of phase into the grid of the first audio. The characteristic of the feedback voltage is determined by the setting of the Radiorgan buttons. To attenuate the high notes, more highs are fed back. To attenuate the low notes, more lows are fed back. For normal reproduction, both highs and lows are fed back and results in no overall change in tone.

The 6BA6 1st IF tube is also the phono pre-amplifier. The output from the phono oscillator is fed to the grid of the 6BA6 through C21 and R14. The amplified output is taken from the screen grid and fed back through R12 and C20 into the volume control circuit and the grid of the 6T8 1st audio amplifier.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM IF's. Observe the same precautions when making adjustments.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 95-1063. Be sure to add the speaker code letter to the transformer Part Number when ordering replacements.

12 (c)		270 ohms	45 Mc. Unmodulated	FM	45 Mc.	C7 Det., C7 Ant.	Align detector and ant. stages for maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless a IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter Lug 3 on 3rd IF transformer (Limiter Grid).

(d) Loosen Slugs by applying a hot iron to the cement.

TUBE TRIMMER LOCATION AND DIAL CABLE DRAWING

The 9F22 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands. The Radiorgan tone control is of the low impedance type in which a portion of the audio voltage is taken from the speaker voice coil and fed back out of phase into the grid of the first audio. The characteristic of the feedback voltage is determined by the setting of the Radiorgan buttons. To attenuate the high notes, more highs are fed back. To attenuate the low notes, more lows are fed back. For normal reproduction, both highs and lows are fed back and results in no overall change in tone.

The 6BA6 1st IF tube is also the phono pre-amplifier. The output from the phono oscillator is fed to the grid of the 6BA6 through C19 and R11. The amplified output is taken from the screen grid and fed back through R12, and C12 into the volume control circuit and the grid of the 6T8 1st audio amplifier.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: A coil slug arrangement tunes the 100 MC FM band. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM IF's. Observe the same precautions when making adjustments.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 9S-1063. Be sure to add the speaker code letter to the transformer Part Number when ordering replacements.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 8C0 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

ZENITH RADIO CORP.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 7 6BE6 Converter	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L-10, 11, 14, 15, 16, 18 and 19.	Align I. F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet.		1600 Kc. Modulated	BC	1600 Kc.	C4	Set oscillator to dial scale.
3			1400 Kc. Modulated	BC	1400 Kc.	C3 and C2	Align det. and ant. stages.
4 (a)	Pin 1 (grid) on 6AU6 Limiter	.05 Mfd.	10.7 Mc. Unmodulated	FM		L20 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)		.05 Mfd.	10.7 Mc. Unmodulated	FM		L21 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 6AU6 2nd IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM		L16 and L17 Prim. and Sec. of 3rd IF trans.	Align 3rd IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 6BA6 1st IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM		L12 and L13 Prim. and Sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 6BE6 converter tube	.05 Mfd.	10.7 Mc. Unmodulated	FM		L8 and L9 Prim. and Sec. of 1st IF transformer	Align 1st IF transformer for maximum reading.
9 (c)(d)	FM Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM	98 Mc.	L6 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c)(c)		270 ohms	98 Mc. Unmodulated	FM	98 Mc.	L4 and L3 Det. and RF coil Slugs	Align det. and ant. stages to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments. The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter Lug 3 on 3rd IF transformer (Limiter Grid).

(d) Loosen Slugs by applying a hot iron to the cement.

BAND-SWITCH SHOWN
AT 2ND POSITION
FM-100 MC BAND

ZENITH RADIO CORP.

MODEL 14H789,
CHASSIS 13D22

The 11C21 chassis incorporate a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

AM Alignment: The alignment of this chassis on the short wave and standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool (fiber screw driver) or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counterclockwise. After adjustments the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F. s. Observe the same precautions when making adjustments. The second 8.3 Mc IF stage is overcoupled. Overcoupling gives a wide band pass with good sensitivity. When an overcoupled stage is aligned with an unmodulated signal, the stage must be loaded. A 300 ohm carbon resistor soldered across the secondary of the second IF transformer provides a satisfactory load for this circuit. The resistor leads must be kept short to reduce the distributed capacity of the circuit.

When aligning a loaded stage, it will be found that considerable signal from the generator will be required, and that it will tune broadly. **THE LOAD RESISTOR MUST BE REMOVED AFTER ALIGNMENT.**

If the signal generator used does not have sufficient output to overcome the temporary loss caused by the load resistor, the load resistance may be increased or the signal fed into the preceding stage.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 9) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when this meter starts to go to the left (negative) of zero will give the same results.

MODEL 14H789,
CHASSIS 13D22

ZENITH RADIO CORP.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 8 on Converter Tube 6SB7 socket	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L15, 16, 19, 20, 23 and 24	Align I.F. channel for maximum output
2	Pin 1 on R.F. tube 6AG5 socket	.05 Mfd.	455 Kc. Modulated	Aut.	Press any button on Auto.	C10	Adjust wavetrap to minimum
3	2 Turns loosely coupled to wavemaq.		1600 Kc. Modulated	BC	1600 Kc.	C17	Set oscillator to dial scale
4	2 Turns loosely coupled to wavemaq.		1400 Kc. Modulated	BC	1400 Kc.	C15 & C4	Align det. and ant. stages. Set oscillator to dial scale
5	Antenna Post (Re-move line ant.)	400 ohms	11.7 Mc. Modulated	SW	11.7 Mc.	C16	
6	Antenna Post (Re-move line ant.)	400 ohms	11.7 Mc. Modulated	SW	11.7 Mc.	C9	Align ant. stage
7	Antenna Post (Re-move line ant.)	400 ohms	9.7 Mc. Modulated	SW	9.7 Mc.	C8	Align ant. stage Repeat Oper. 6 for maximum output
8 (a)	Pin 4 grid on 6SH7 limiter socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L25 coil slug primary disc.	Align primary of discriminator for maximum reading
9 (b)	Pin 4 grid on 6SH7 limiter socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L26 coil slug sec. of disc.	Adjust secondary of disc. for zero reading
10 (c)	Pin 6 (grid) on 7W7 2nd IF tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L21 & L22 prim. & sec. of 3rd IF transformer	Align 3rd IF transformer for maximum reading
11 (c)	Pin 4 (grid) on 6SG7 1st IF tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L17 & L18 prim. & sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading
12 (c)	Pin 8 (grid) on 6SB7 converter tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L13 & L14 prim. & sec. of 1st IF transformer	Align 1st IF transformer for maximum reading
13 (c)	Antenna Post (Re-move line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L10 Osc. coil Slug	Set oscillator to dial scale
14 (c)	Antenna Post (Re-move line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L5 and L3 Det. and RF coil slugs	Align det. and Ant. stage to maximum reading
15 (c)	Antenna Post (Re-move line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C22	Set oscillator to dial scale
16 (c)	Antenna Post (Re-move line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C14 and C6	Align detector and ant. stages for maximum reading

IMPORTANT: Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

A correct alignment can only be made if the following procedure is followed.

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead must be shielded.

An ordinary AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter pin 5 on discriminator transformer to chassis (half discriminator load.)

(b) Vacuum Tube Voltmeter pin 7 on discriminator transformer to chassis (full discriminator load.)

(c) Vacuum Tube Voltmeter 6SH7 limiter grid (pin 4 to chassis).

(d) 300 ohm 1/2 watt carbon resistor soldered across the secondary L18 (pin 2 and 3 of 2nd IF trans.). The leads to the resistor must be as short as possible and the resistor removed before operation L3 is started.
